

# ***Thermal-Aware System-Level Design of 2D/3D MPSoC Architectures***

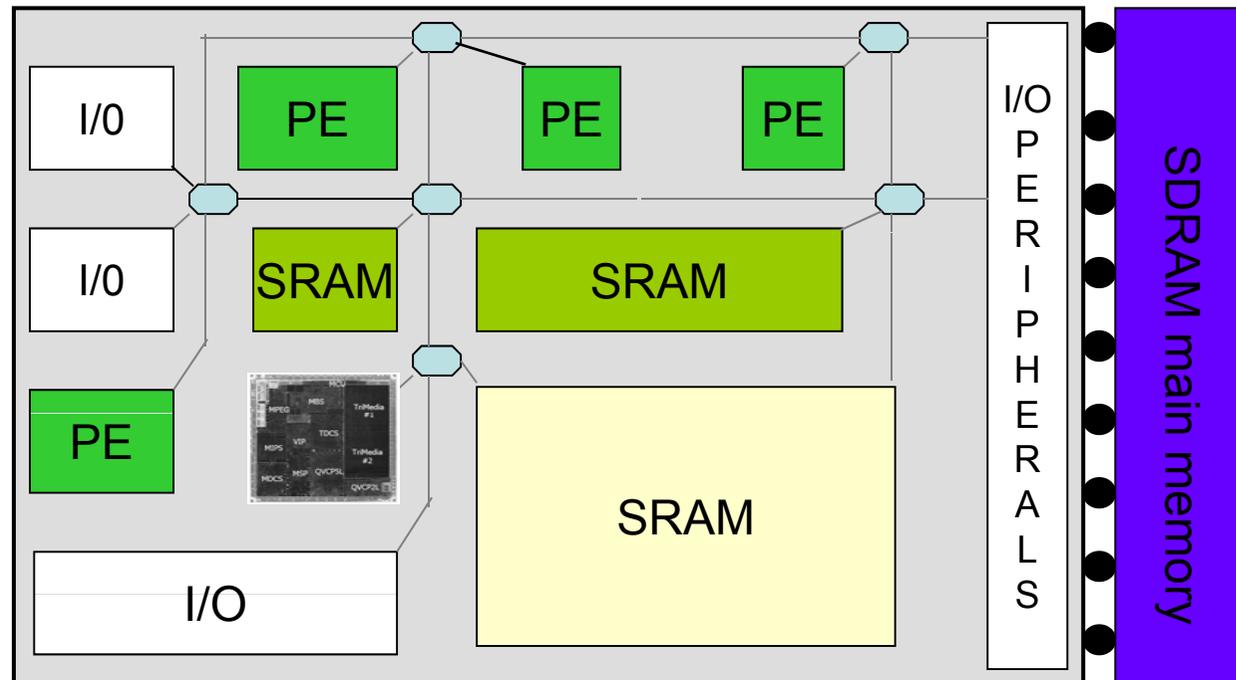

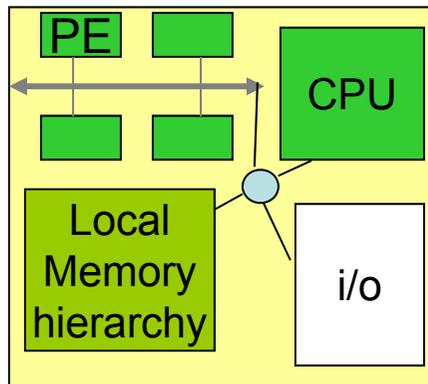

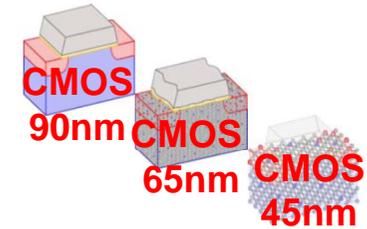

*David Atienza*

*Embedded Systems Laboratory (ESL),  
Ecole Polytechnique Fédérale de Lausanne (EPFL)*

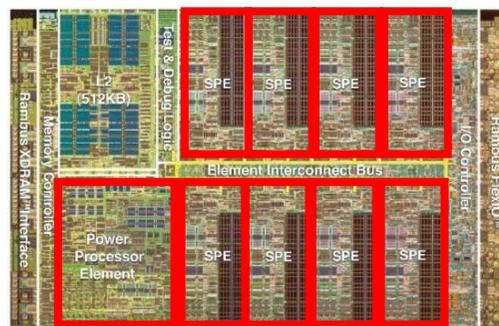

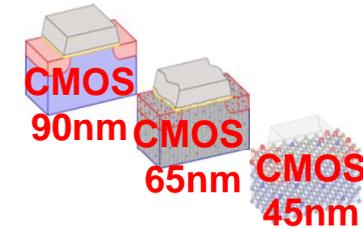

# Evolution to Multi-Processor System-on-Chip (MPSoC)

- Roadmap continues: 90→65→45→32 nm
- Multi-Processor System-on-Chip (MPSoC) architectures are a reality for a while...

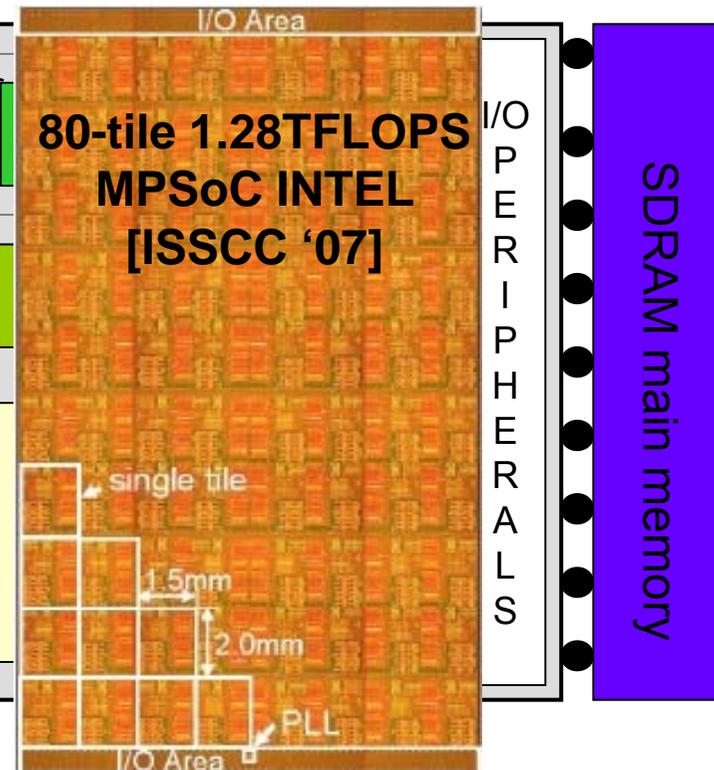

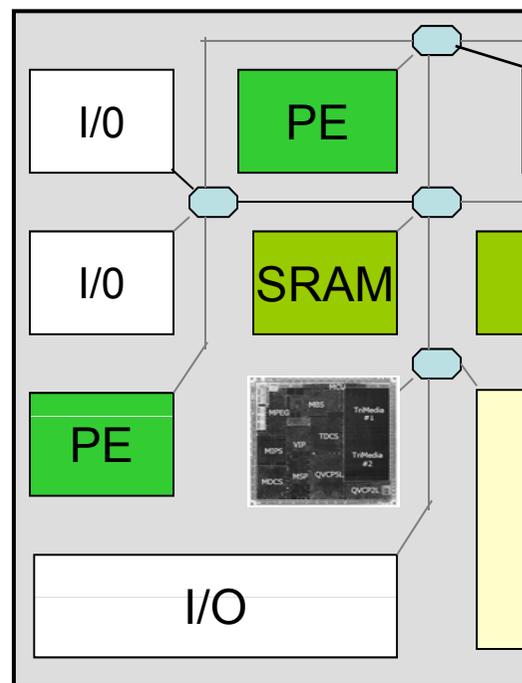

# Evolution to Multi-Processor System-on-Chip (MPSoC)

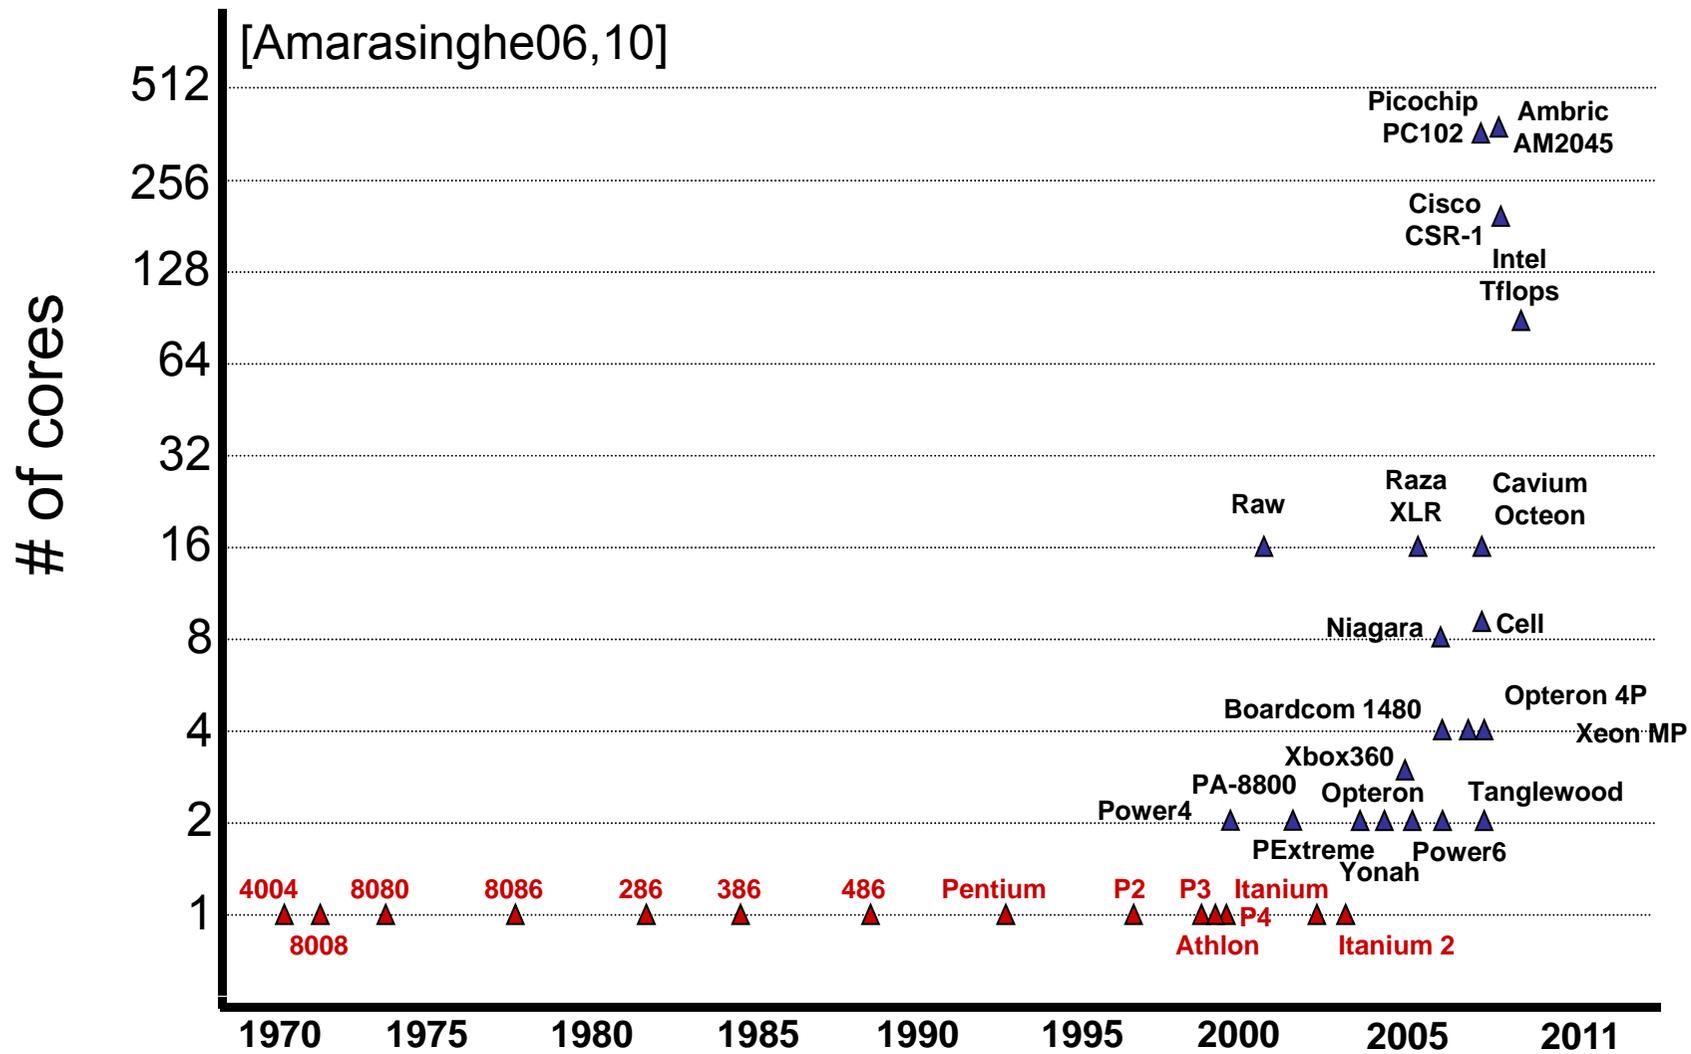

- Roadmap continues: 90→65→45→32 nm
- Multi-Processor System-on-Chip (MPSoC) architectures are a reality for a while...

[Cell Multi-Processor – PS3]

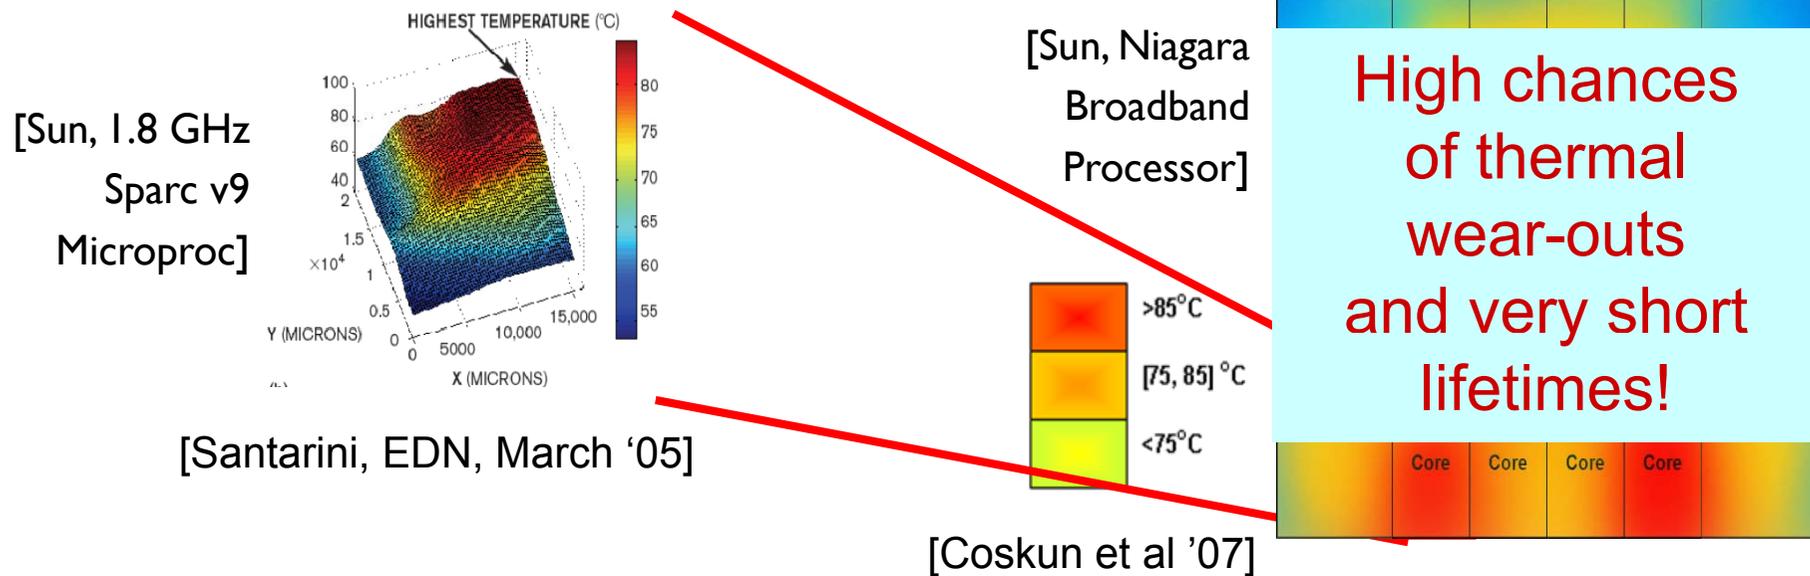

# MPSoCs are Spreading Fast

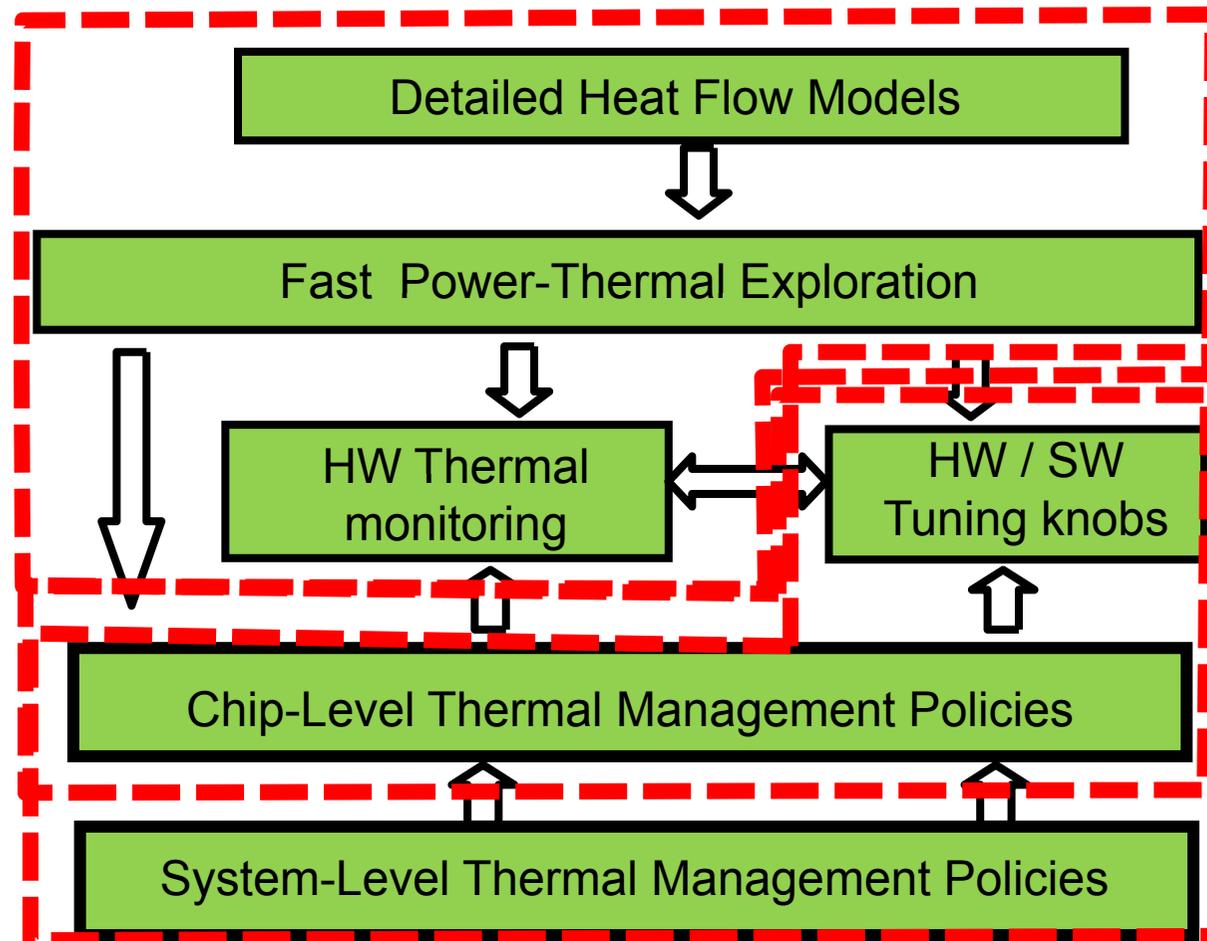

# Design Issues in MPSoCs

- MPSoCs have very complex architectures
  - Advanced components and CAD tools very expensive
  - Time-closure issues, system speed decreased
- Aggravated thermal issues: Thermal-Aware MPSoC Layouts
  - Hot-spots, non-uniform thermal gradients

# Advocating Thermal-Aware 2D/3D MPSoC Design

- Integration of HW/SW modeling and management

# MPSoC Thermal Modeling Problem: Initial Thoughts

## ■ MPSoC Modeling and Exploration

- SW simulation: Transactions, cycle-accurate (~100 KHz)  
[Synopsys Realview, Mentor Primecell, Madsen et al., Angiolini et al.]

**At the used cycle-accurate level, they are too slow for thermal analysis of real-life applications!**

## ■ Heat Flow Modeling

- Finite-Element simulation  
[COMSOL Multiphysics [FEMLAB]

**Too computationally intensive and very complex to tune in MPSoC with limited set of sensing components!**

- High-order RC-level heat flow models  
[Hotspot, Link et al.]

**Not close-loop interaction at run-time with inputs from MPSoC components!**

# MPSoC Thermal Modeling Problem: Initial Thoughts

- MPSoC Modeling and Exploration
  - SW simulation: Transactions, cycle-accurate (~100 KHz)  
[Synopsys Realview, Mentor Primecell, Madsen et al., Angiolini et al.]

**At the used cycle-accurate level, they are too slow for thermal analysis of real-life applications!**

- Heat Flow Modeling
  - Finite-Element simulation

**Request: Fast (and relatively accurate) thermal model for MPSoCs that enables close-loop run-time interaction with limited set of sensing components!**

- High-order RC-level heat flow models  
[Hotspot, Link et al.]

**Not close-loop interaction at run-time with inputs from MPSoC components!**

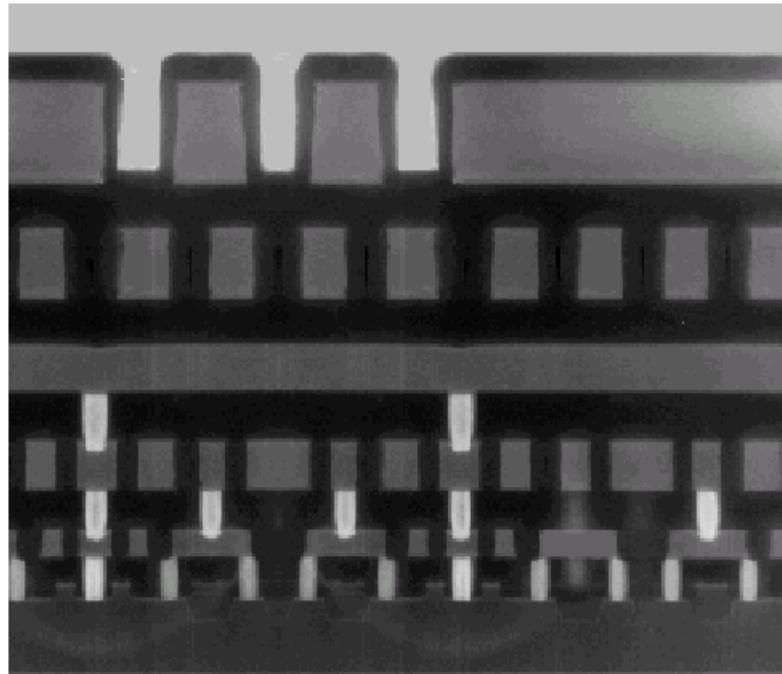

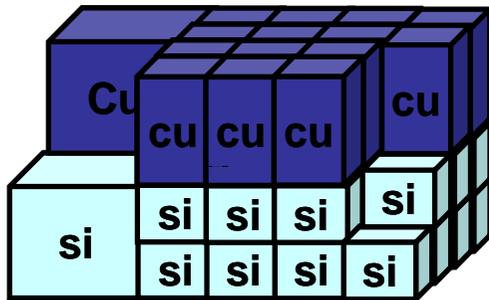

# RC-Based Thermal Modeling for MPSoC

## ■ Model interface

- Input: power model of tier components, geometrical properties
- Output: temperature of tier components at run-time

## ■ Thermal circuit: 1<sup>st</sup> order RC circuit

- Heat flow ~ Electrical current ; Temperature ~ Voltage
- Metal and Si layers composed of elementary blocks

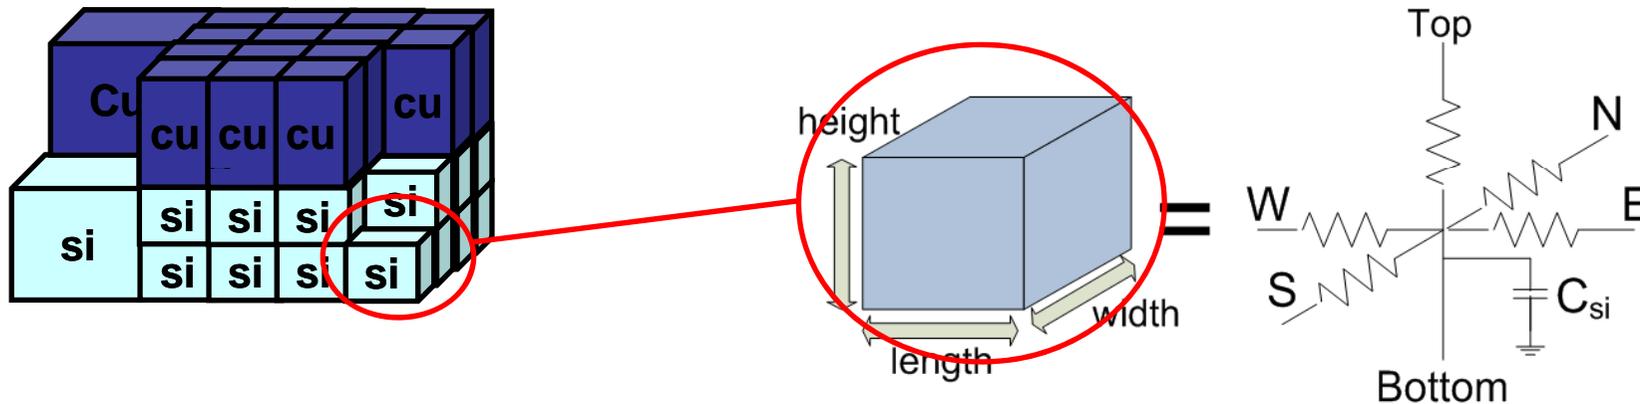

# RC-Based Thermal Modeling for MPSoC

## ■ Model interface

- Input: power model of tier components, geometrical properties
- Output: temperature of tier components at run-time

## ■ Thermal circuit: 1<sup>st</sup> order RC circuit

- Heat flow ~ Electrical current ; Temperature ~ Voltage
- Metal and Si layers composed of elementary blocks

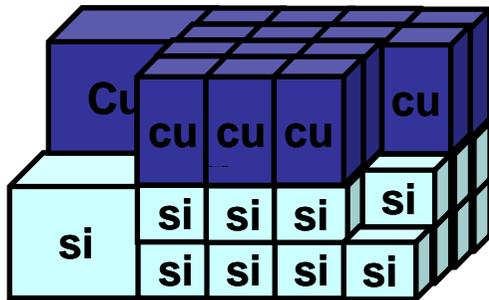

# RC-Based Thermal Modeling for MPSoC

## ■ Model interface

- Output: temperature of tier components at run-time

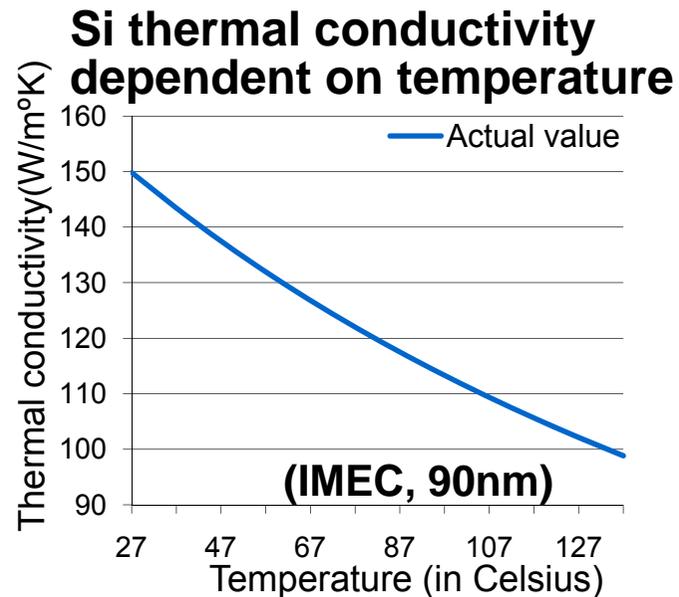

## ■ Thermal circuit: 1<sup>st</sup> order RC circuit

- Heat flow ~ Electrical current ; Temp
- Metal and Si layers composed of ele

**Thermal conductance matrix**

**Thermal capacitance matrix**

[Atienza, et al., TODAES 2007]

**Temperature change**

**Temperature vector at instant k**

**power consumption vector**

$$C \dot{t}_k = -G(t_k) t_k + p_k(t_{k-1}) \quad k = 1..m$$

# Discrete RC-Thermal Estimation Tool for tiers of 3D Chips

$$C \dot{t}_k = -G(t_k)t_k + p_k ; k = 1..m$$

- Creating linear approximation while retaining variable Si thermal conductivity:

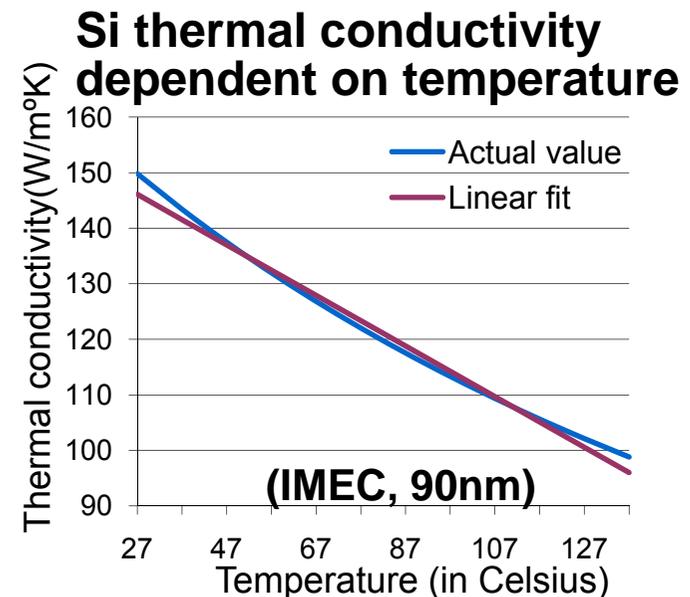

- Si thermal conductivity linearly approx. :  $G_{i,i}(t_k) = l + q t_k$

- Numerically integrating in discrete time domain the  $\dot{t}_k$  :

$$t_{k+1} = A(t_k)t_k + Bp_k ; k = 1..m$$

$$A(t_k) = (I - d_t C^{-1} G(t_k)) ; B = d_t C^{-1}$$

**Time step chosen small  
enough for convergence**

# Discrete RC-Thermal Estimation Tool for tiers of 3D Chips

$$C \dot{t}_k = -G(t_k)t_k + p_k ; k = 1..m$$

- Creating linear approximation while retaining variable Si thermal conductivity:

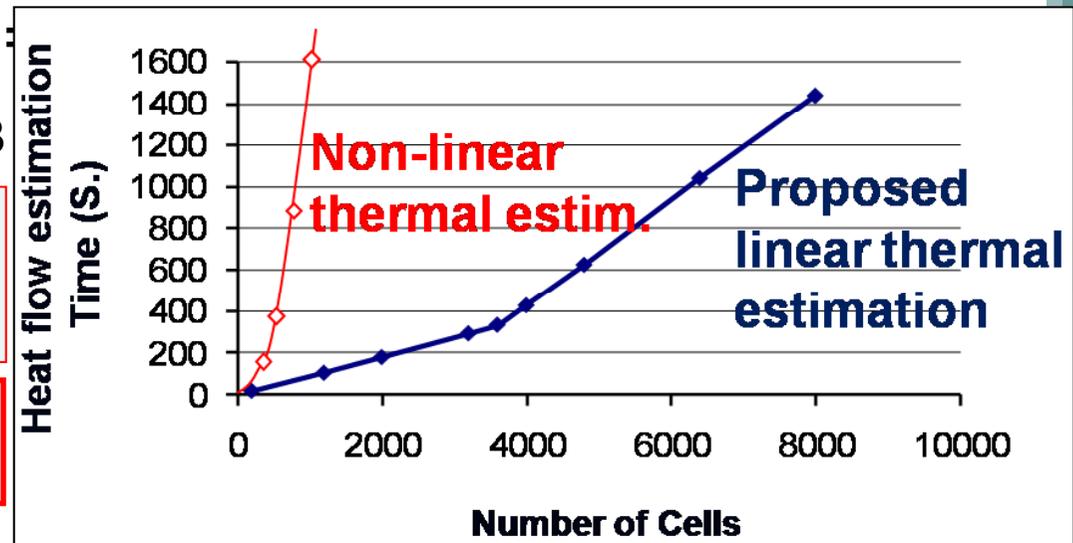

- Si thermal conductivity linearly approx. :  $G_{i,j}(t_k) = l + q t_k$
- Numerically integrating in discrete time domain the  $\dot{t}_k$  :

$$t_{k+1} = A(t_k)t_k + Bp_k ; k = 1..m$$

$$A(t_k) = (I - d_t C^{-1} G(t_k)) ; B = d_t C^{-1}$$

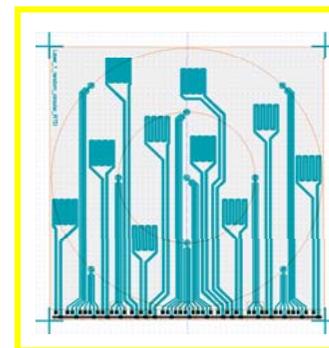

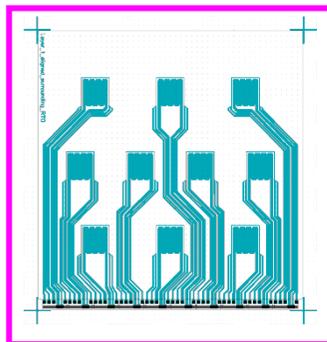

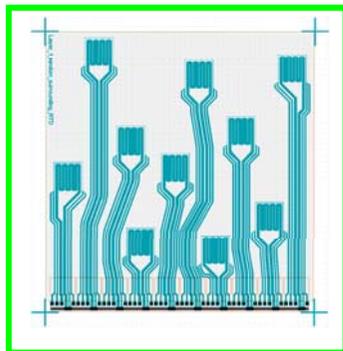

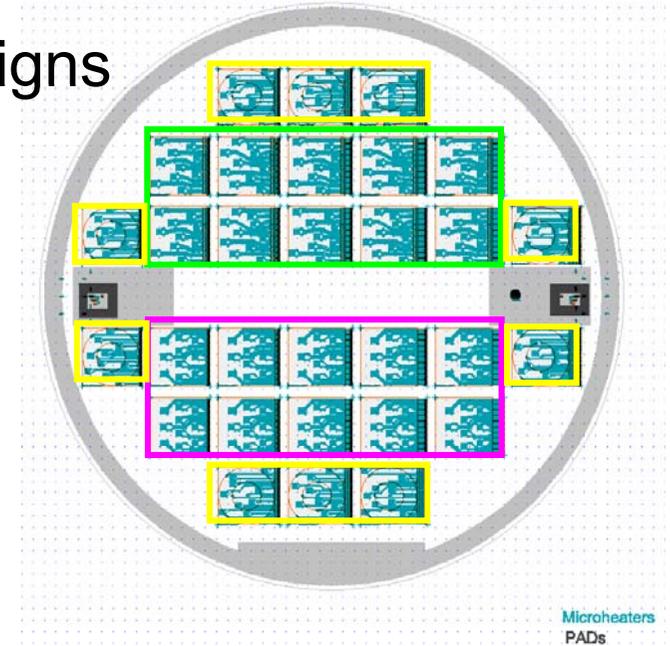

Complexity scales linearly with the number of modeled cells (simulated on Xeon Server)

Thermal library validated against finite element model (IMEC and EPFL)

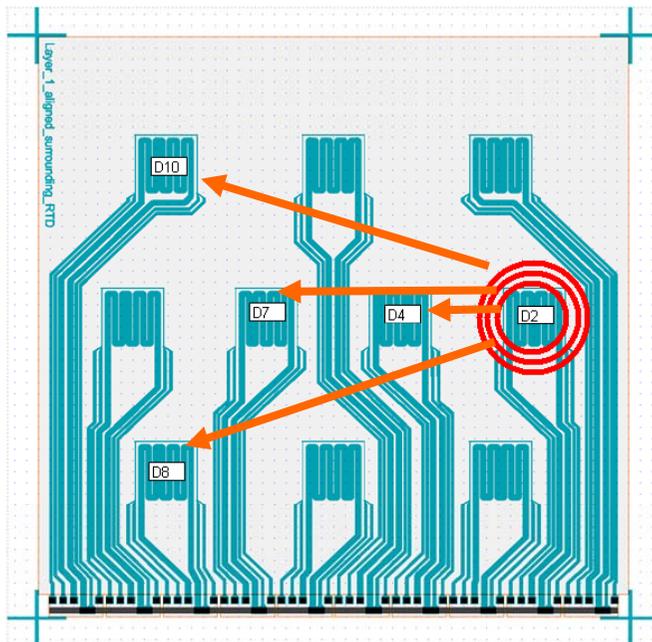

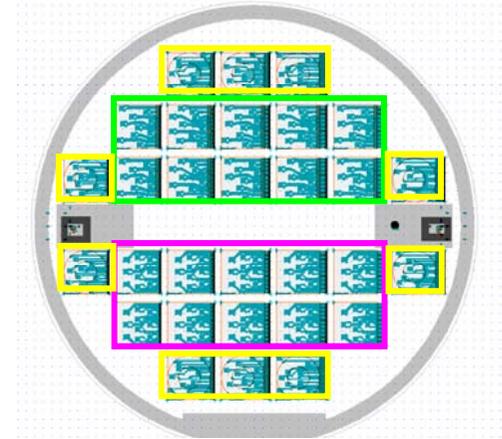

# MPSoC Thermal Library Validation

- Extensible set of layers in MPSoC designs
  - Pre-defined material layers and components:  
Silicon, copper (10 layers), packaging, interposer, bumps, etc.
- Configurable nr. of cells and iterations per tier
  - Initially 10ms thermal interval (1000 iterat./tier)
- Test chips manufactured at EPFL:
  - Three types of layouts

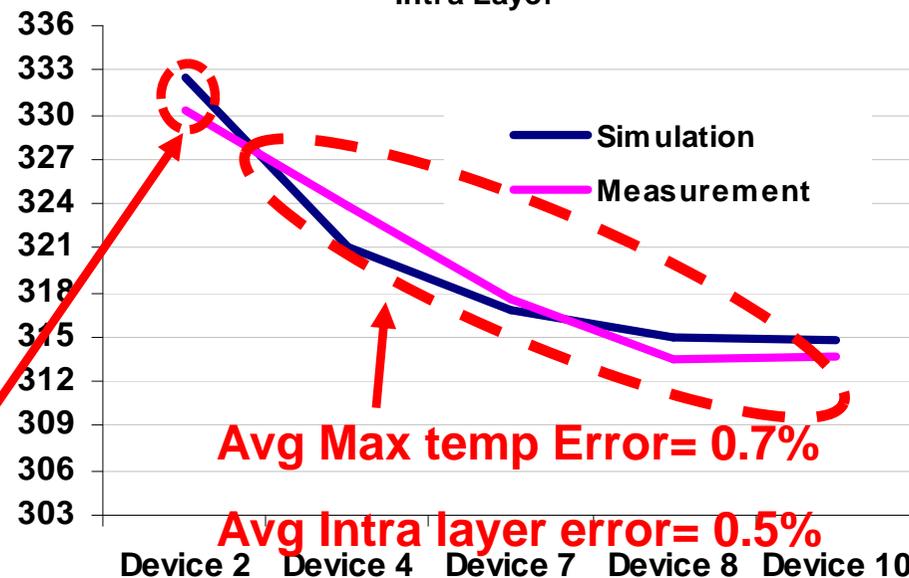

# Correlation Results: Intra-Tier Heat Transfer

- Lateral heat flow
  - Tested range: 0.5W to 10W per heater
  - Similar accuracy results at different tiers
- Measurements/simulations in case ~9W:

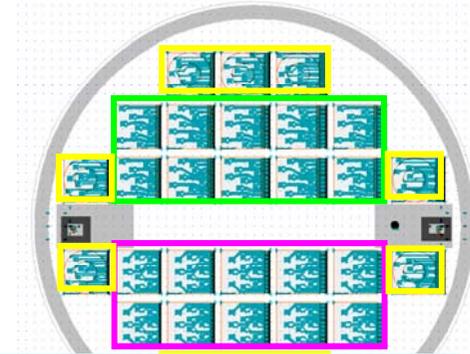

Heater and sensor at the same point (Max temp)

Temp (Kelvin)

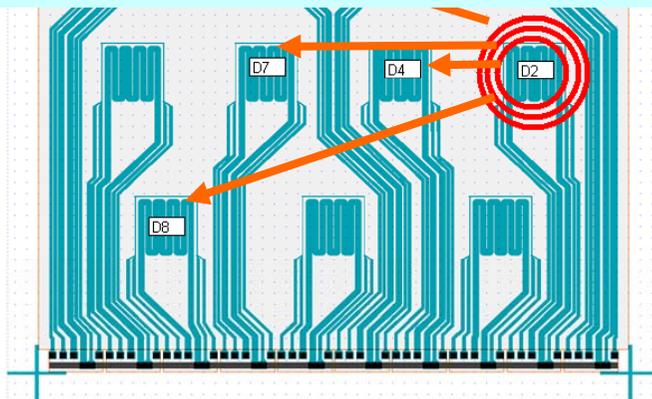

# Correlation Results: Intra-Tier Heat Transfer

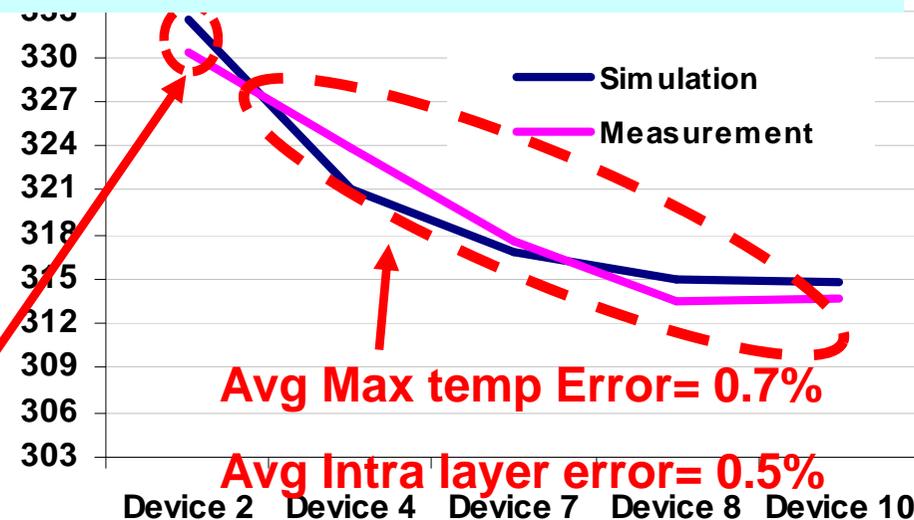

- Lateral heat flow
  - Tested range: 0.5W to 10W per heater
  - Similar accuracy results at different tiers
- Measurements/simulations in case ~9W:

Variations of less than 1.5% between 3D chip measurements and RC-based 3D thermal model

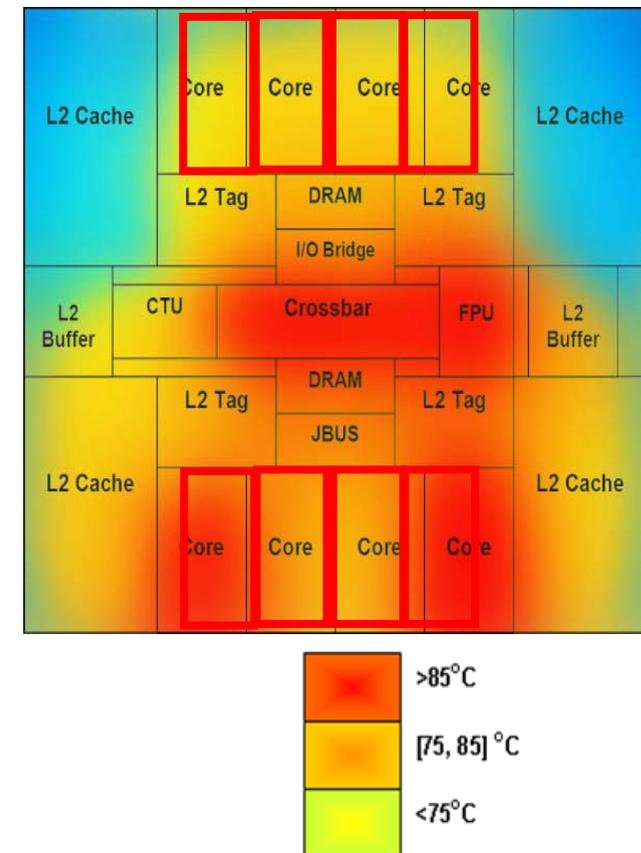

Heater and sensor at the same point (Max temp)

# Temperature Management is Power Control under Thermal Constraints

- Power consumption of cores determines thermal behavior
  - Power consumption depends on frequency and voltage
  - Setting frequencies/voltages can control power and temperature
  
- Optimization problem: frequency/voltage assignment in MPSoCs **under thermal constraints**
  - Meet processing requirements
  - Respect thermal constraint at all times
  - Minimize power consumption

# Thermal Management: Initial Thoughts

- Static approach: thermal-aware placement to try to even out worst-case thermal profile [Sapatnekar, Wong et al.]
  - Computationally difficult problem (NP-complete)

**Not able to predict all working conditions, and leakage changing dynamically, not useful in real systems**

**No formalization of thermal optimization problem!**

- Dynamic approach: HW-based dynamic thermal management
  - Clock gating based on time-out [Xie et al., Brooks et al.]
  - DVFS based on thresholds [Chaparro et al, Mukherjee et al,]
  - Heuristics for component shut down, limited history [Donald et al]

**Techniques to minimize power, they only achieve thermal management as a by-product...**

# Formalization of Thermal Management Problem in MPSoCs

- Control theory problem

- Observer

- HW

- P

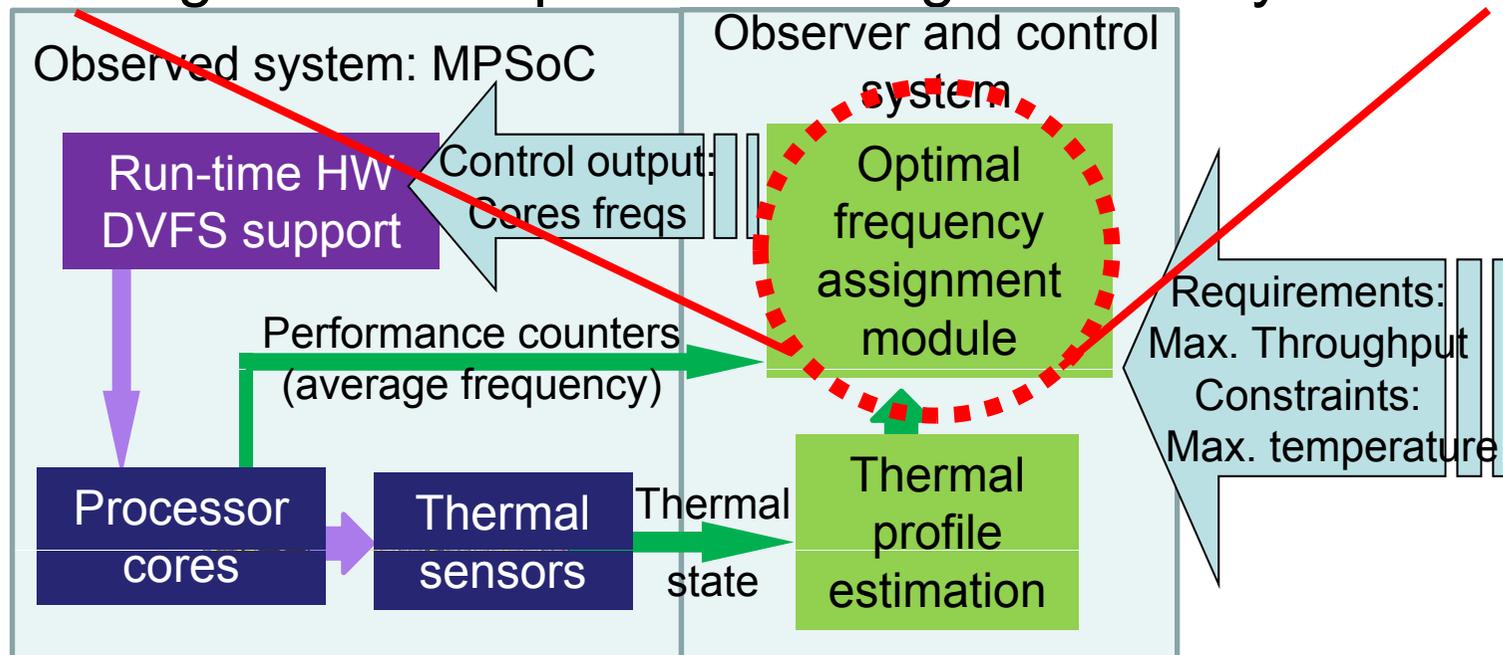

- Control

- Tuning knobs: frequencies/voltages of the system

Optimal frequency assignment module, 2-phase approach:

- Design-time phase:** Find optimal sets of frequencies for the cores for different working conditions

- Run-time phase:** Apply one of the predefined sets found in phase 1 for the required system performance

# Pro-Active Based Thermal Control: Phase 1 – Design-Time

- Predictive model of thermal behavior given a set of frequency assignments

Allowed core power values and frequencies

Chip floorplan

Packaging, heat spreader information

Phase inputs

## Non-linear offline problem

Minimize sum of power consumption of cores

Constraints:  $\sum_{k=1}^m \mathbf{1}^T f_k \geq m \times n \times f_{avg}$

Performance constraint: on average, freq. is  $f_{avg}$

$$t_{k+1} = A(t_k)t_k + Bp_k, \quad k = 1, \dots, m$$

Thermal equation

$$t_k \leq t_{max}, \quad k = 1, \dots, m$$

Meet temp. constraints at all time points

$$p_{max} f_{i,k}^2 / f_{max}^2 = p_{i,k}, \quad i = 1, \dots, n, \quad \forall k$$

Power equation based on frequency

$$f_{min} \leq f_k \leq f_{max}, \quad k = 1, \dots, m.$$

Frequency in predefined range

Method  
outputs

Table of  
cores  
frequencies  
assignments

# Pro-Active Based Thermal Control: Phase 1 – Design-Time

- Predictive model of thermal behavior given a set of frequency assignments

Allowed core power values and frequencies

Chip floorplan

Packaging, heat spreader information

Phase inputs

## Non-linear offline problem

maximize sum of power consumption of cores

Constraints: 
$$\sum_{k=1}^m \mathbf{1}^T f_k \geq m \times n \times f_{avg}$$

$$t_{k+1} = A(t_k)t_k + Bp_k, \quad k = 1, \dots, m$$

Thermal equation: Si conductivity depends on temp  

$$t_k \leq t_{max}, \quad k = 1, \dots, m$$

$$p_{max} \frac{f_{i,k}^2}{f_{max}^2} = p_{i,k}, \quad i = 1, \dots, n, \quad \forall k$$

Power equation: quadratic dependence on freq.  

$$f_{min} \leq f_k \leq f_{max}, \quad k = 1, \dots, m.$$

Method  
outputs

Table of  
cores  
frequencies  
assignments

# Making Power and Thermal Constraints Convex

- Power constraint adaptation

- Change non-affine (quadratic equality):

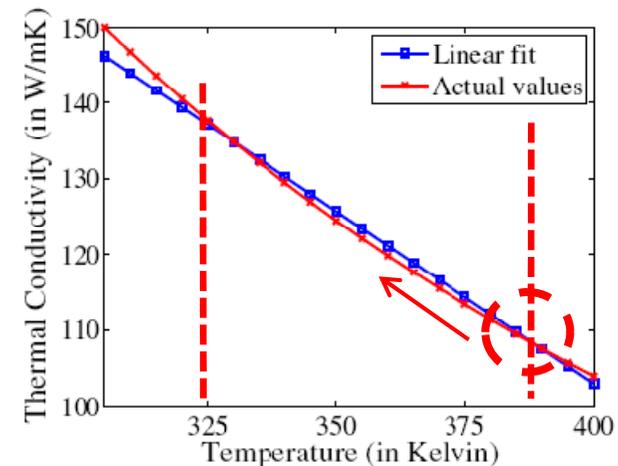

$$p_{\max} (f_{i,k})^2 / (f_{\max})^2 = p_{i,k} ; i = 1, \dots, n, \forall k$$

- To convex inequality:

$$p_{\max} (f_{i,k})^2 / (f_{\max})^2 \leq p_{i,k} ; i = 1, \dots, n, \forall k$$

- Thermal constraint adaptation

- Use worst case thermal conductivity in the range of allowed temperatures, and iterate (if needed) to optimum

# Making Power and Thermal Constraints Convex

- Power constraint adaptation

Solve convex problem and get table of optimal frequencies for different working conditions in polynomial time (number of processors)

Required average frequencies	Starting Temperatures			
	$\leq 30\text{ }^{\circ}\text{C}$	$35\text{ }^{\circ}\text{C}$	■ ■ ■	$100\text{ }^{\circ}\text{C}$
$\leq 100\text{ MHz}$	<120,80,80,120>			
150 MHz				
■				
■				
■				
1000 MHz				

# Pro-Active Based Thermal Control: Phase 2 - Run-Time, Putting It All Together

- Use table of frequencies assignments and index by actual conditions at regular run-time intervals

Targeted operating frequency of cores

Current temperature of cores

Method inputs

## Run-time optimal DVFS assignment module

1) Index table output of pl with current working conc

2) Compare to current assignment to cores and generate required signaling to modify DVFS values

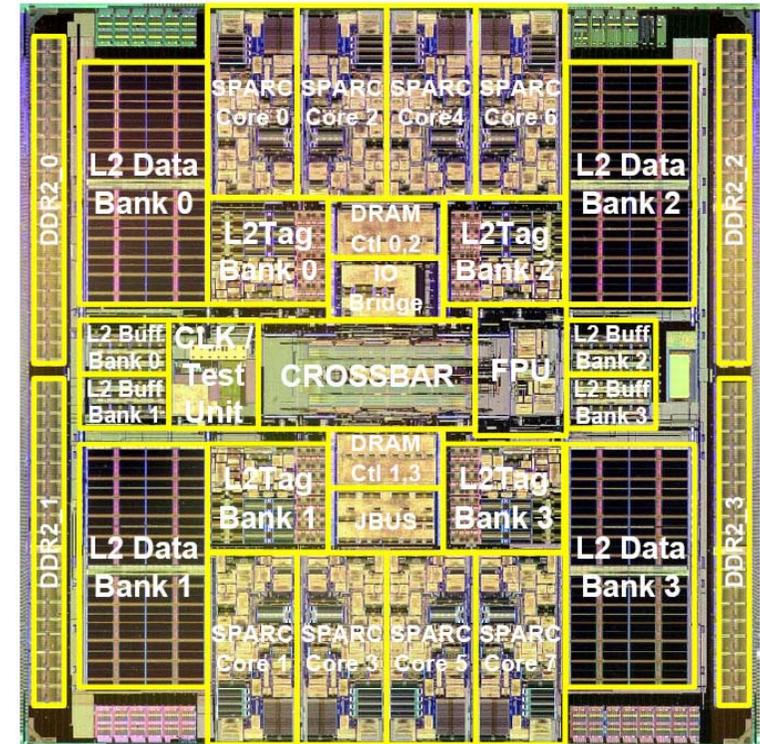

Required average frequencies	Starting Temperatures			
	<= 30 °C	35 °C	...	100 °C
<= 100 MHz	<120,80,80,120>			
150 MHz				
⋮				
1000 MHz				

Phase  
output

Run-time DVFS changes for processors

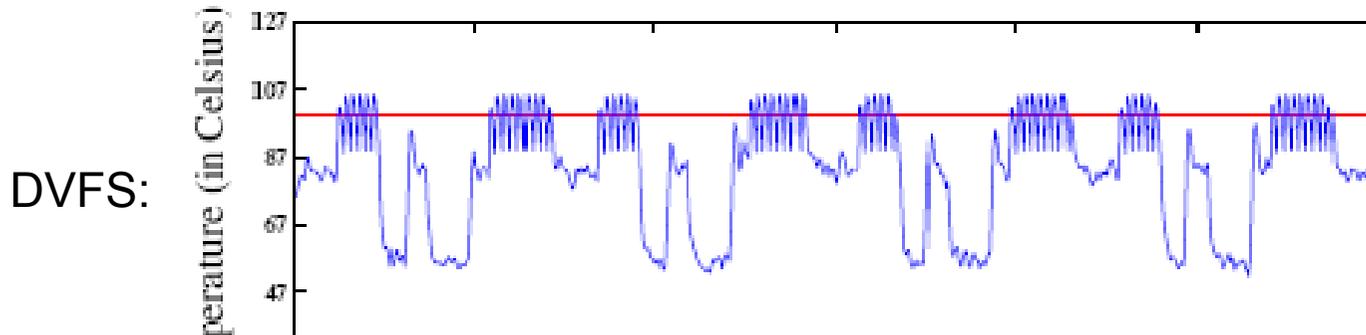

# Case Study: 8-Core Sun MPSoC

- MPSoC Sun Niagara architecture
  - 8 processing cores SPARC T1
- Max. frequency each core: 1 GHz
  - 10 DVFS values, applied every 100ms
- Max. power per core: 4 W
- Execution characteristics of workloads [Sun Microsystems]:
  - Mixes of 10 different benchmarks, from web-accessing to multimedia
  - 60,000 iterations of basic benchmarks, tens of seconds of actual system execution

Sun's Niagara MPSoC

# Thermal Constraints Respected... And Faster overall!

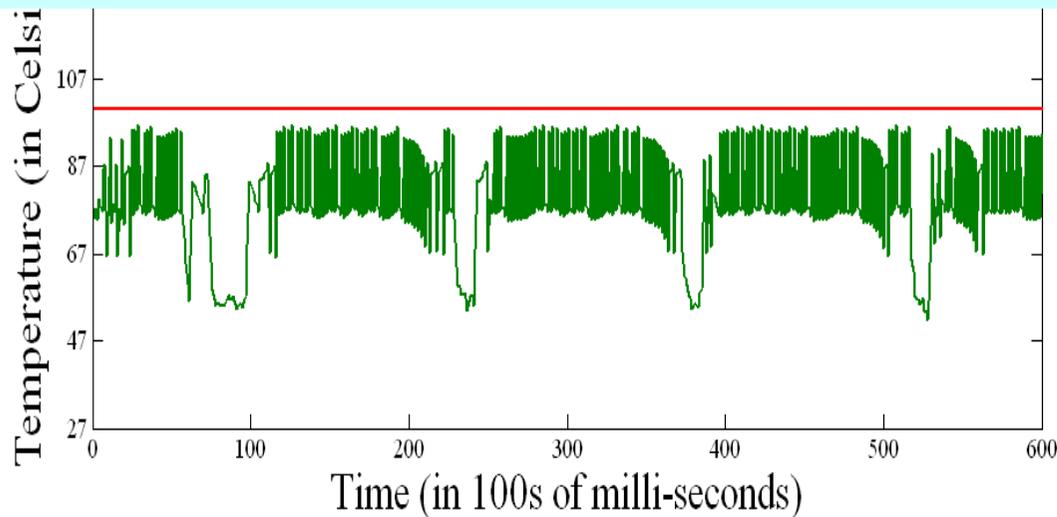

Total  
run-time of  
benchmarks

180 sec

Proposed method achieves better throughput than  
standard DVFS while satisfying thermal constraints

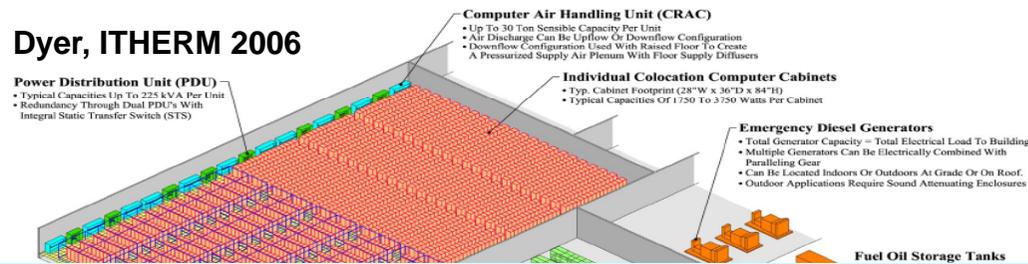

2-phase  
Convex  
method:

106 sec  
(45% less  
exec. time)

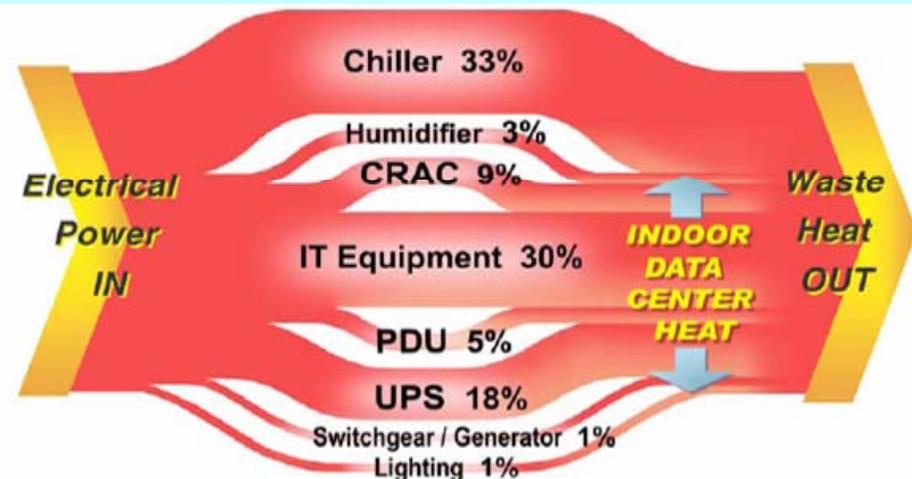

# The Big Picture for Thermal-Aware Design: Large-Scale Computing in Datacenters

- Area is expensive, we try to get denser infrastructures
  - New containers: many more servers each, >10x density

45% of energy overhead in cooling, how to get higher computational densities (with lower cooling costs)?

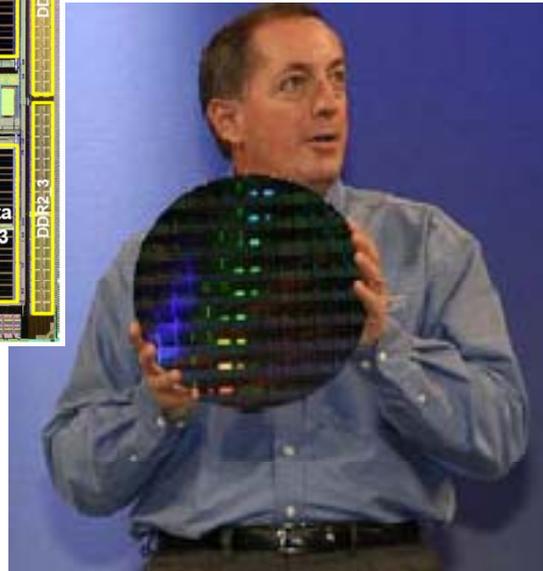

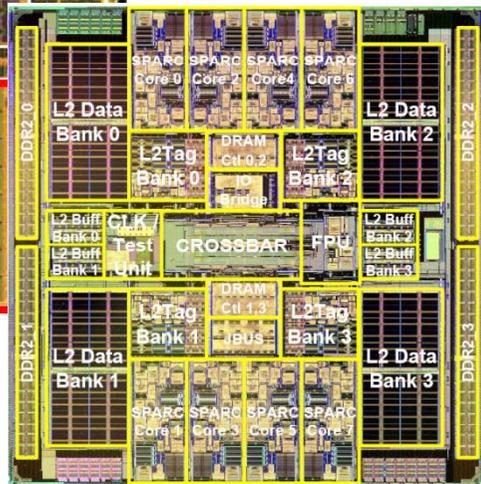

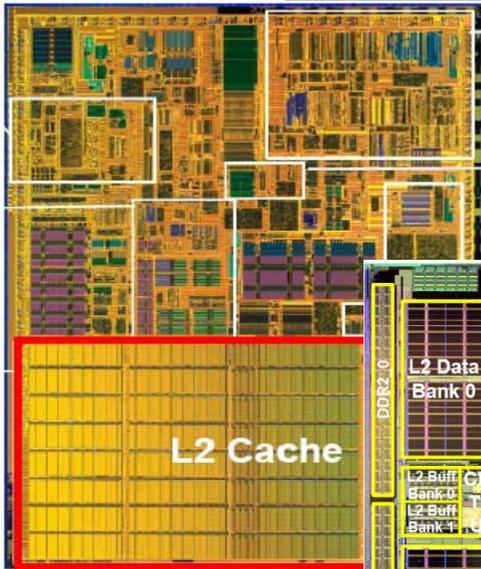

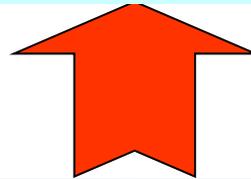

- Air-cooled datacenters are very inefficient**
  - Cooling needs as much energy as IT... and thrown-away
- For a 10MW datacenter **~US\$ 4M wasted** per year

Datacenter energy overhead, ASHRAE

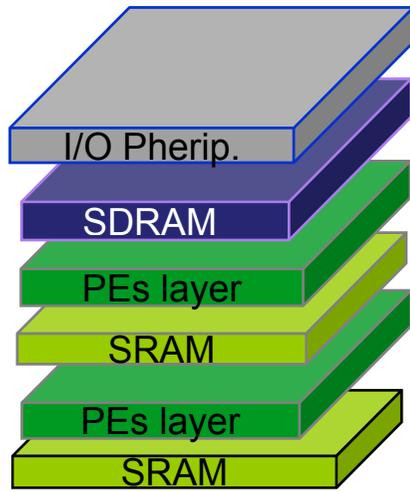

# Processing Trends: Single to Multi-Core

How do you feed so many cores?  
Memory bandwidth wall!

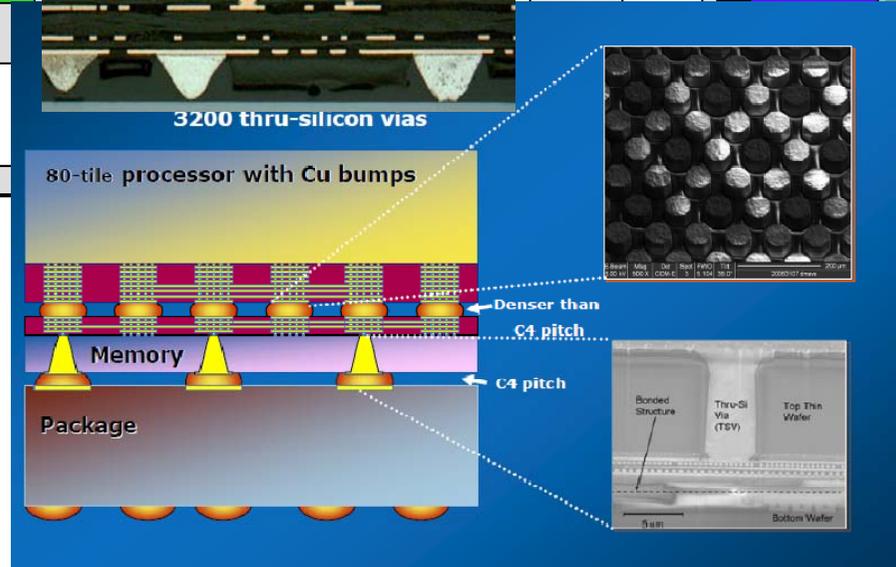

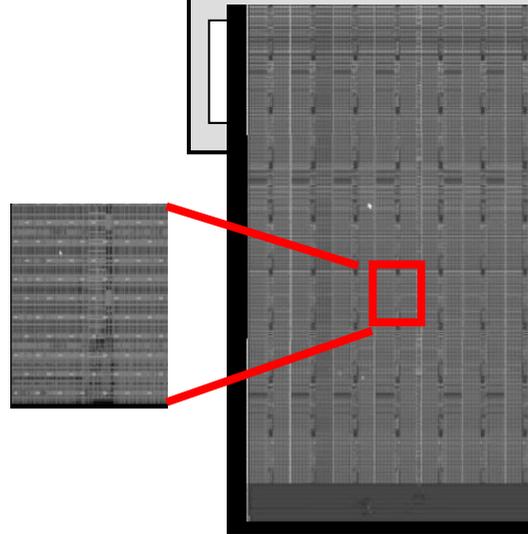

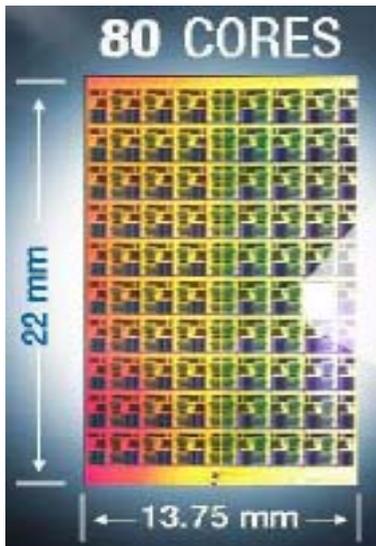

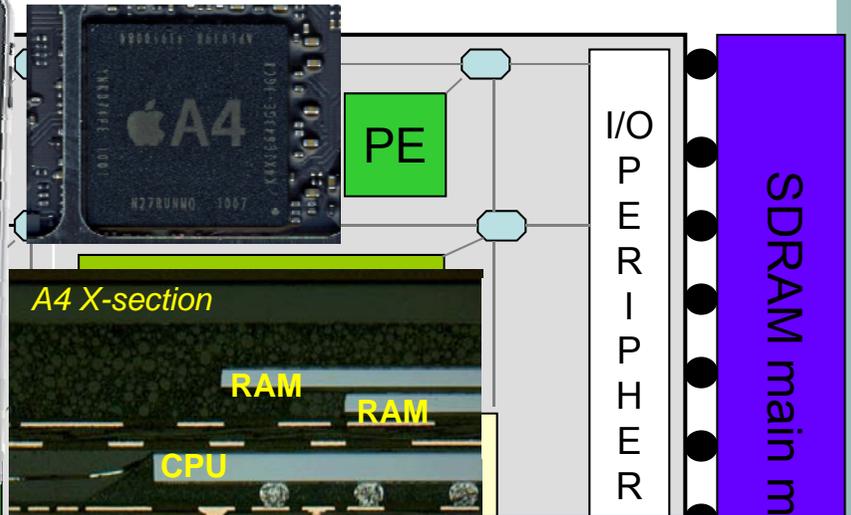

[Courtesy: Yuan Xie, ICCAD 2010]

  - 30-40% of carbon footprint in Europe using district heating networks
- Direct re-use of heat output
  - 3D MPSoC architectures

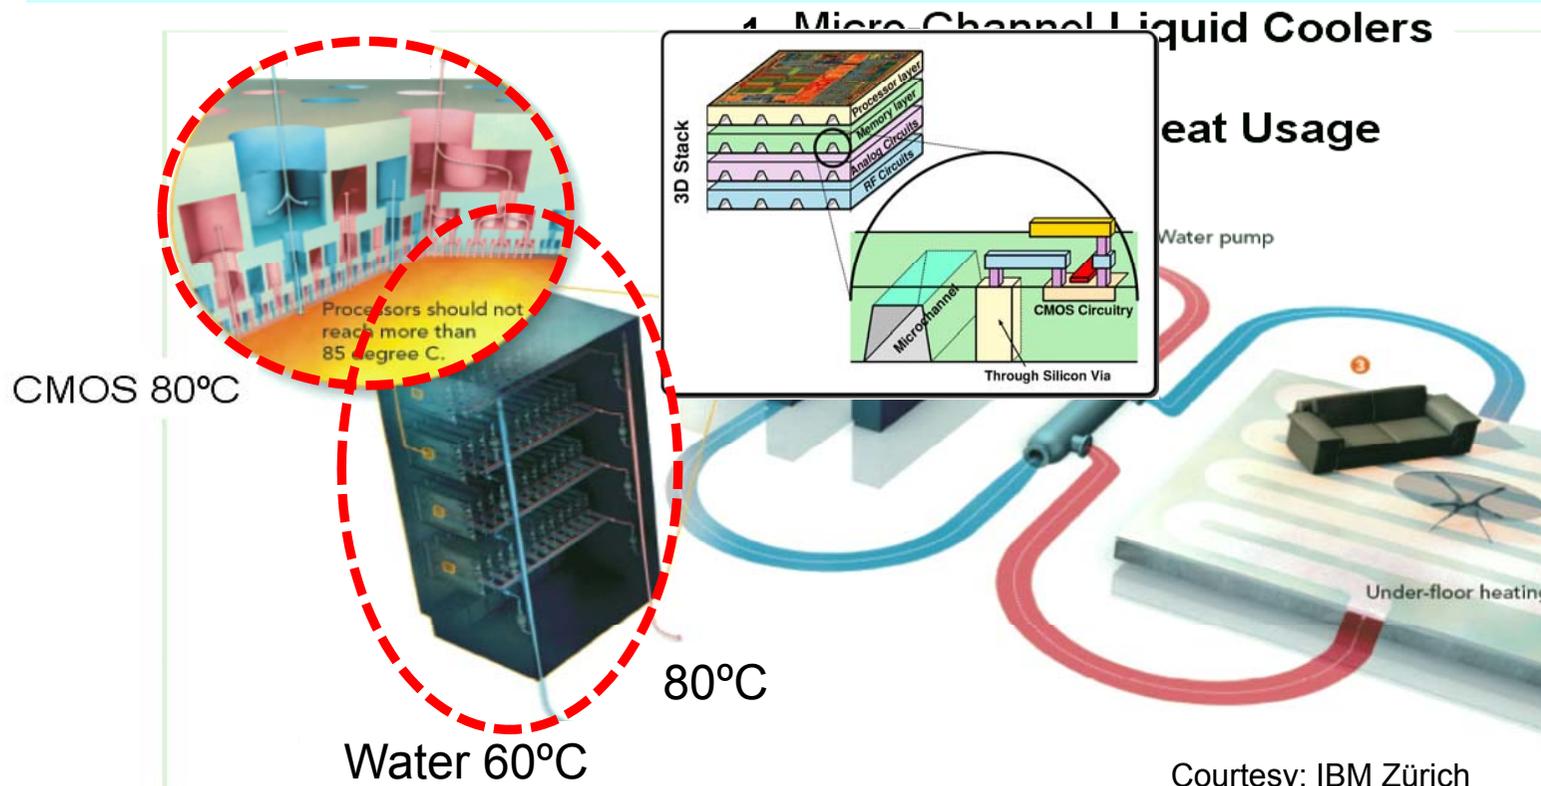

**Aquasar datacenter server: 80% payback of electricity costs**

# NanoTera CMOSAIIC Project: Design of 3D MPSoCs with Advanced Cooling

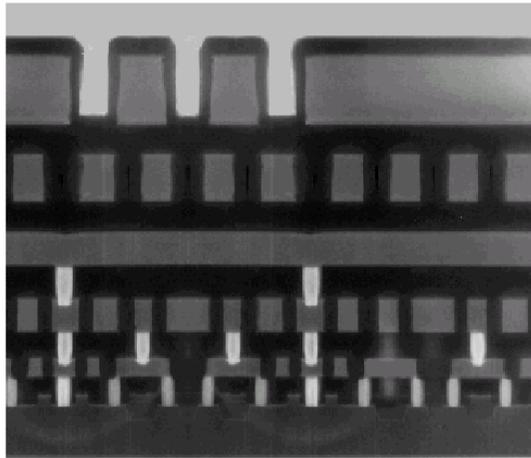

- 3D systems require novel electro-thermal co-design
  - Academic partners: EPFL and ETHZ
  - Industrial: IBM Zürich and T.J. Watson

3D MPSoC datacenter chip: microchannels etched on back side to circulate (controlled) liquid coolant

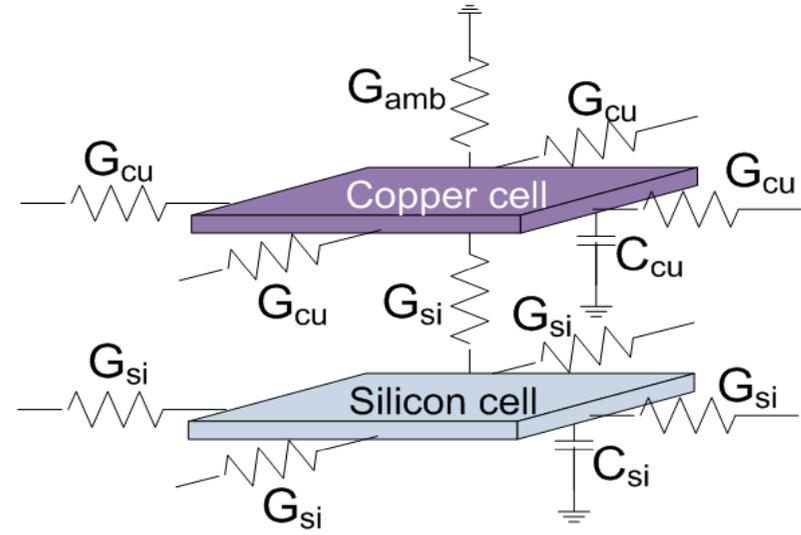

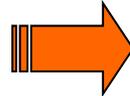

# Creating a Fast Thermal Model: Compact RC-Based Stack Model with TSVs

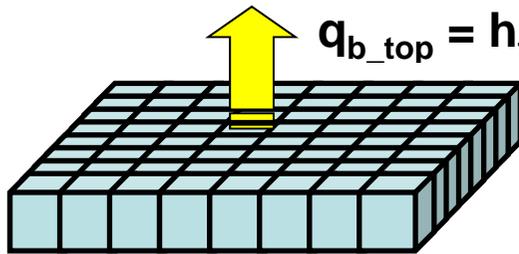

- Chip-Level thermal model

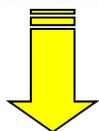

RC Network of  
Si/metal layer  
cells

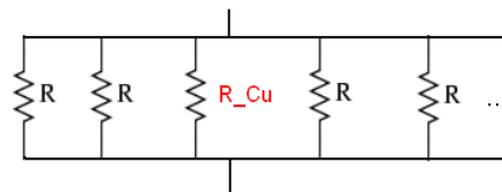

- Convective boundary conditions between layers **for each tier separately**

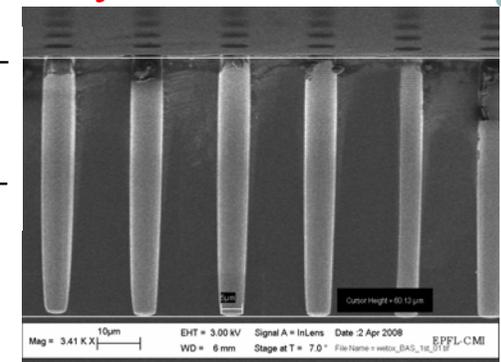

$$q_{b\_top} = h_{top} A (T_a - T_{top})$$

$$q_{b\_bottom} = h_{bottom} A (T_a - T_{bottom})$$

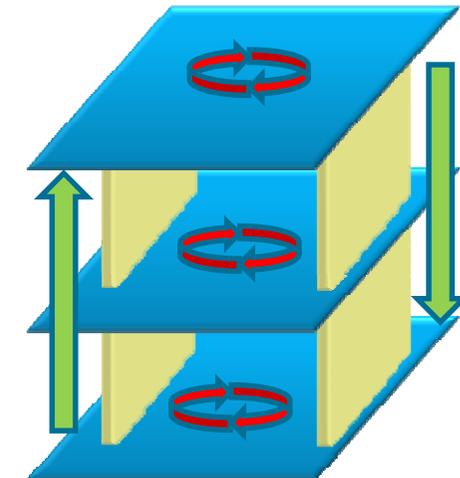

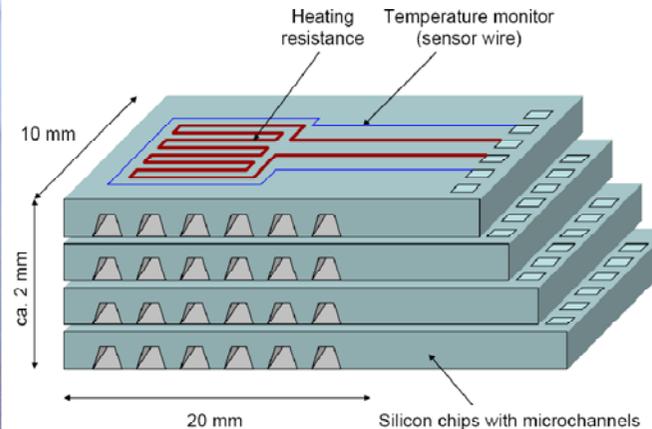

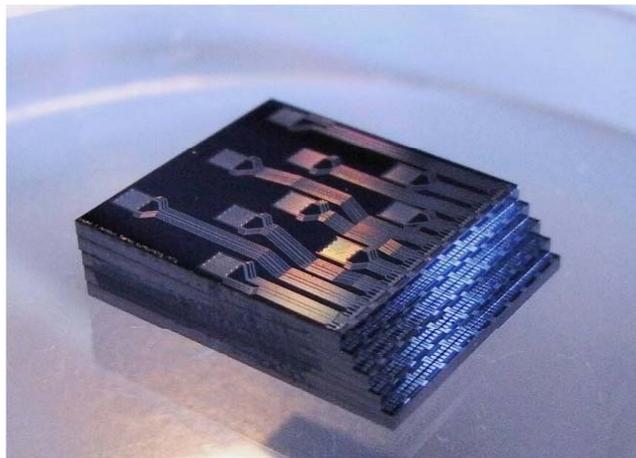

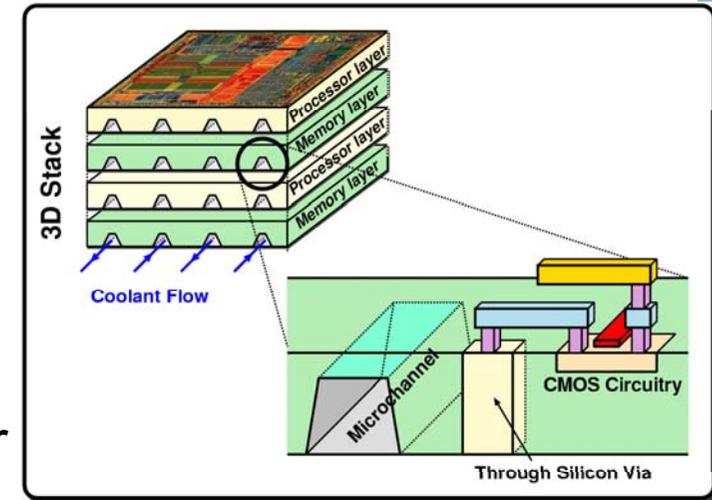

- TSVs change **resistivity** of interlayer material

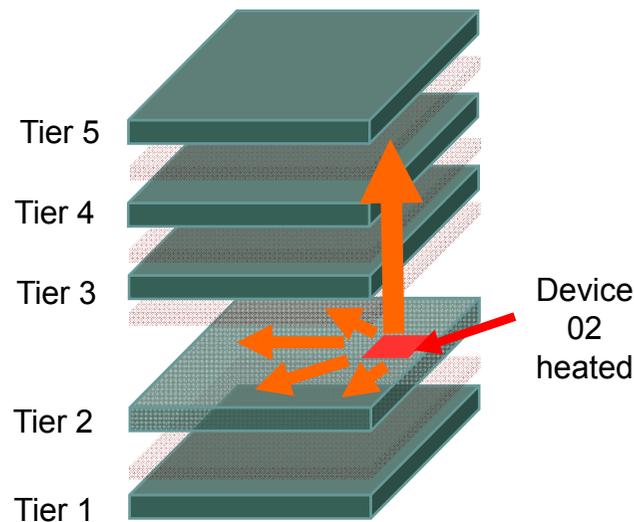

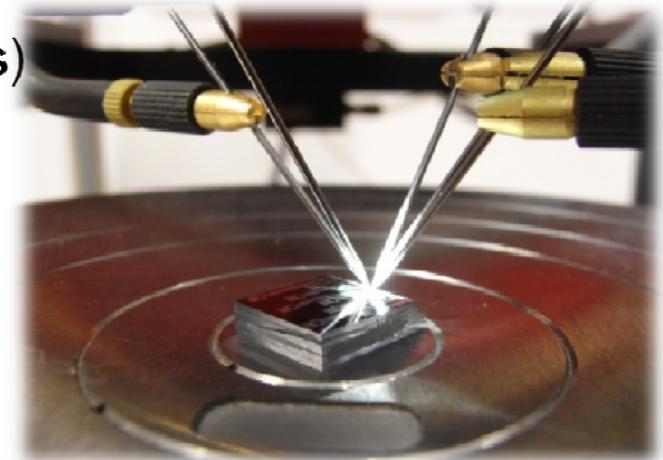

# 3D MPSoC Thermal Library Deployment

- Extensible set of layers in 3D stack
  - Up to 9 tiers and heat spreader
  - Pre-defined layers:
    - Silicon, copper (10 layers), glue, overmold, interposer, bump
- Configurable nr. of cells and iterations per tier
  - Also 10ms thermal interval (1000 iterat./tier)
- Multi-tier test chip manufactured at EPFL:

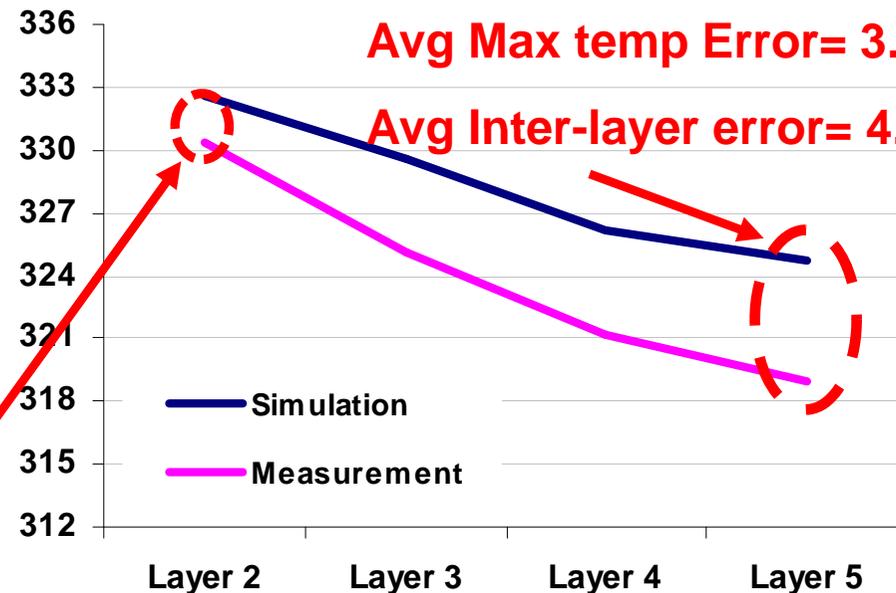

# Correlation Results: Inter-Tier Heat Transfer

- Vertical heat flow (multi-level measurements)
  - Tested range: 0.5W to 10W per heater
  - Variations only of global temperatures trend
  - Tier-2 measurements/simulations (~9W):

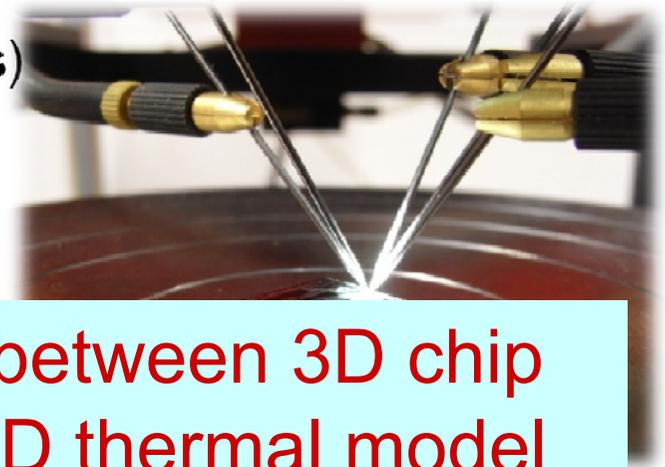

Heater and sensor at the same point (Max temp)

Temp (Kelvin)

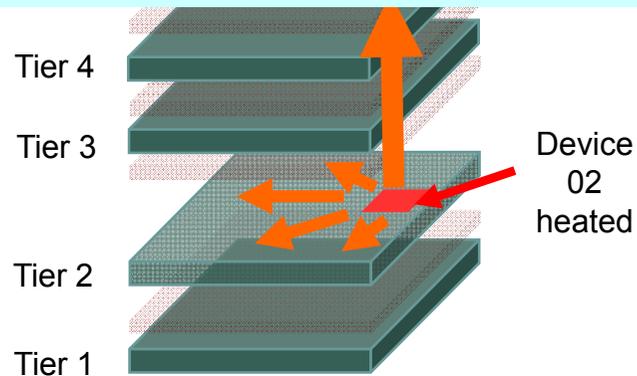

# Correlation Results: Inter-Tier Heat Transfer

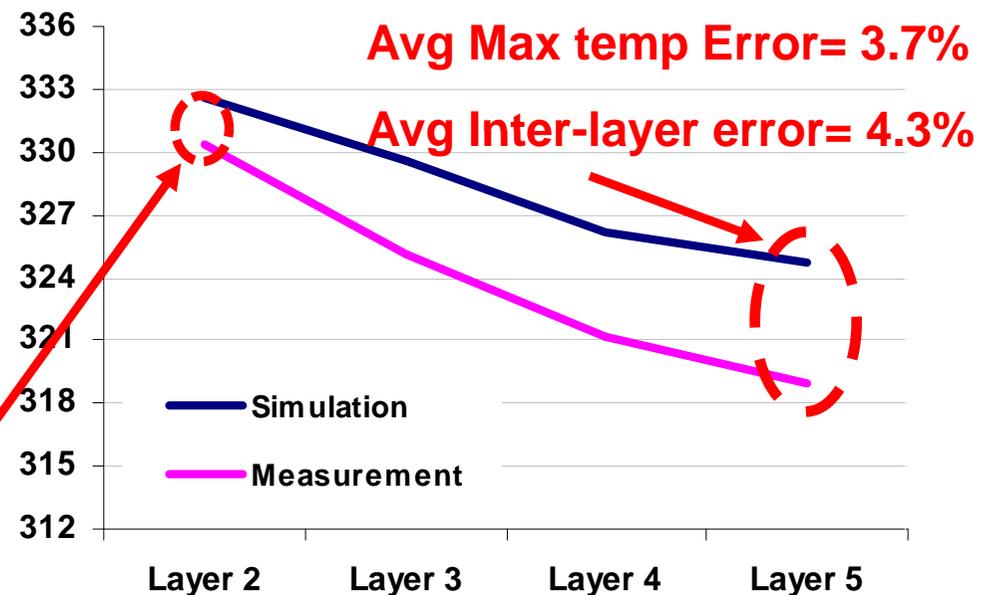

- Vertical heat flow (multi-level measurements)
  - Tested range: 0.5W to 10W per heater
  - Variations only of global temperatures trend
  - Tier 2 measurements/simulations (~0W):

Variations of approximately 5% between 3D chip measurements and RC-based 3D thermal model

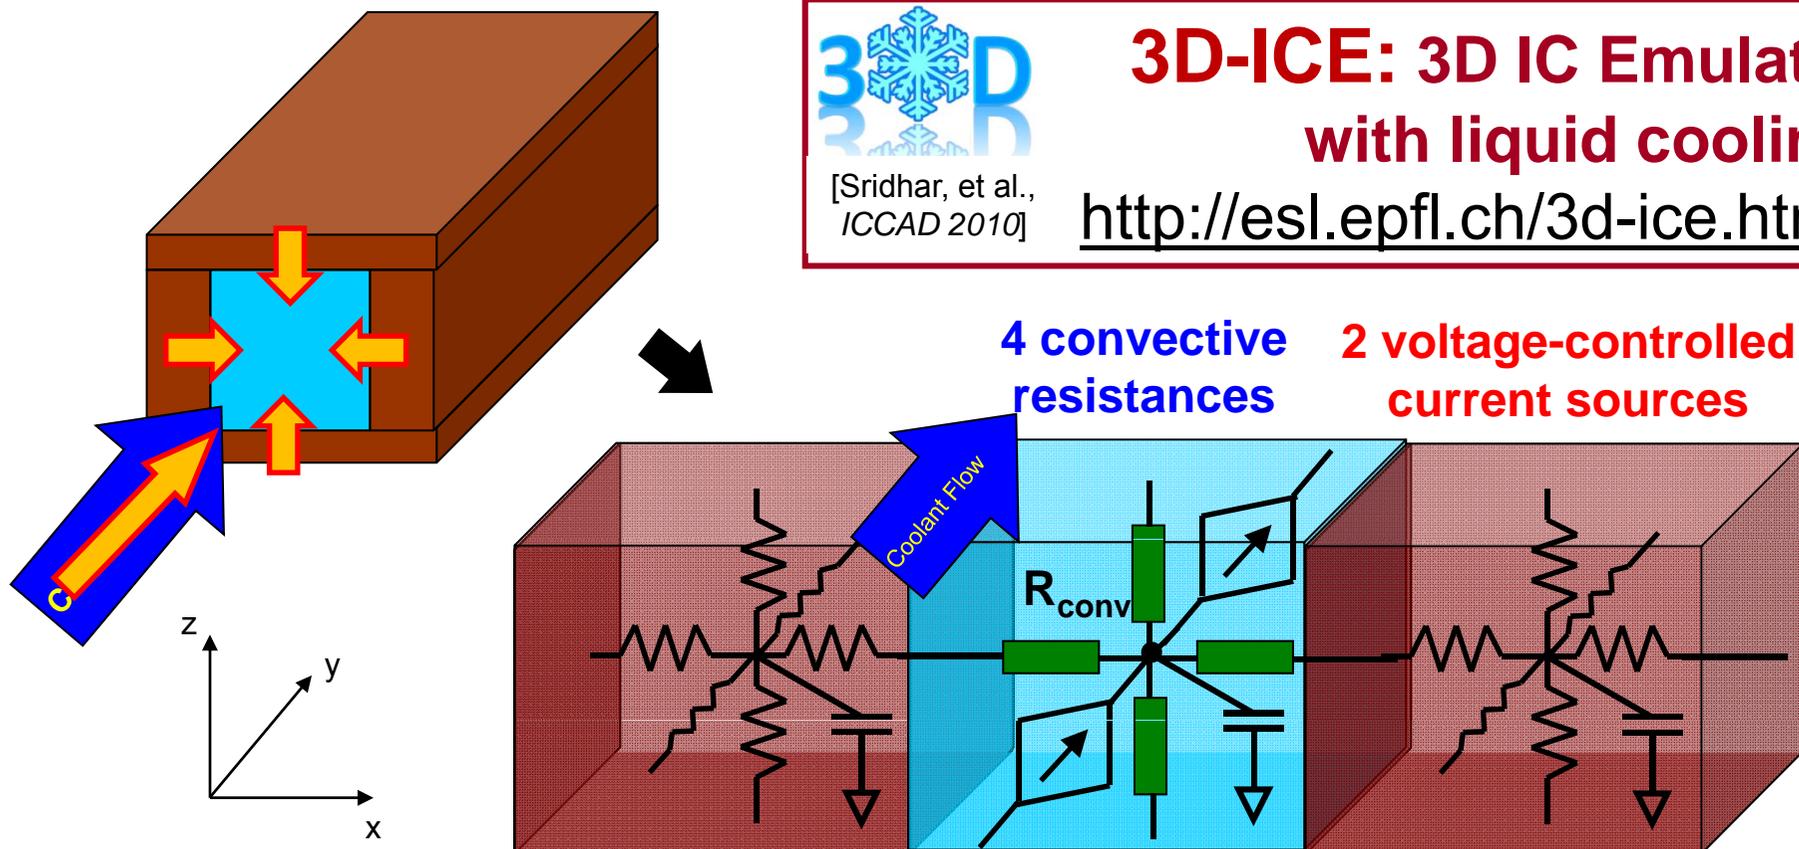

Heater and sensor at the same point (Max temp)

# Modeling Liquid Cooling as RC-Network in 3D MPSoC stacks

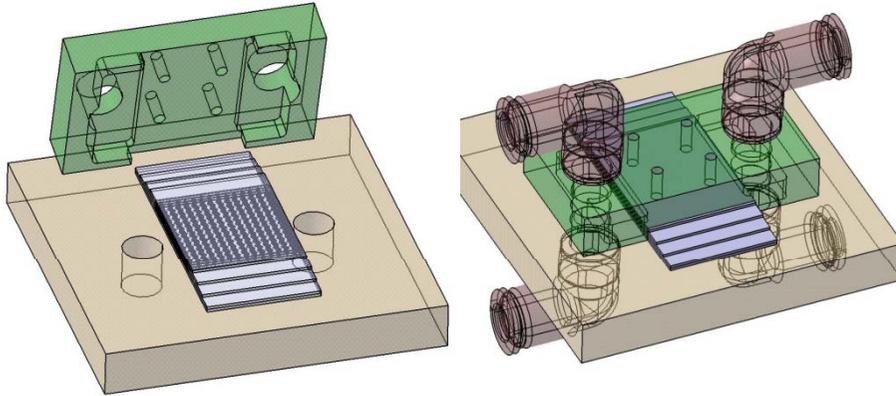

- Local junction temperature modeled as 4-resistor based compact transient thermal model (4RM-based CTTM)
  - $R_{tot} = R_{cond} + R_{conv} + R_{heat}$

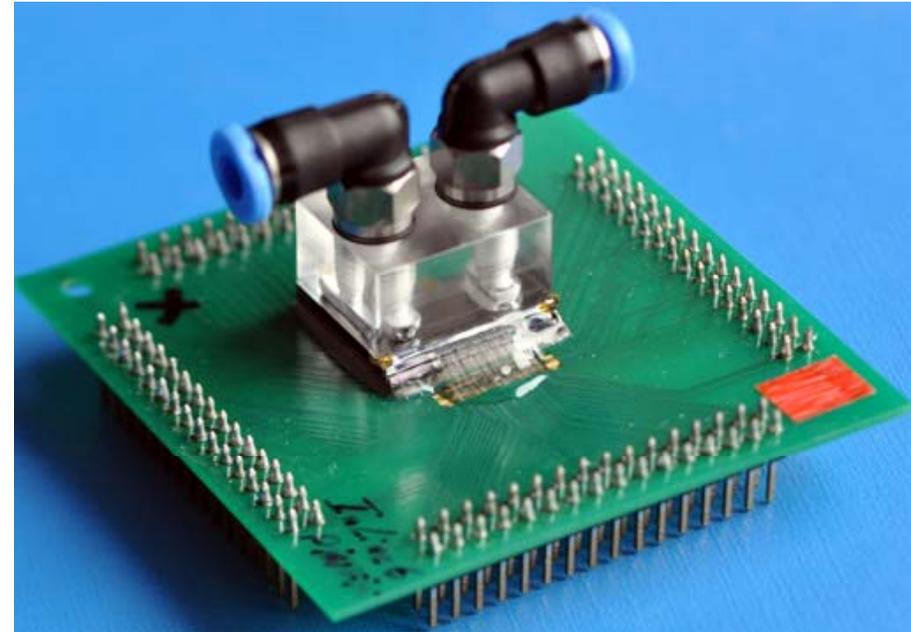

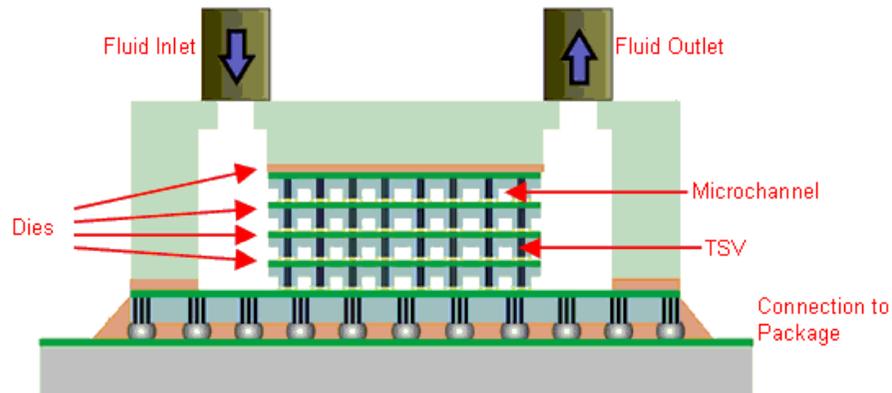

**3D-ICE: 3D IC Emulator  
with liquid cooling**  
<http://esl.epfl.ch/3d-ice.html>

[Sridhar, et al.,  
ICCAD 2010]

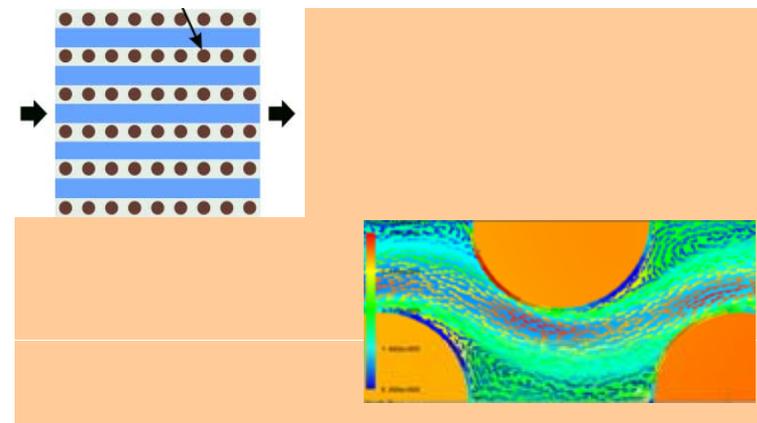

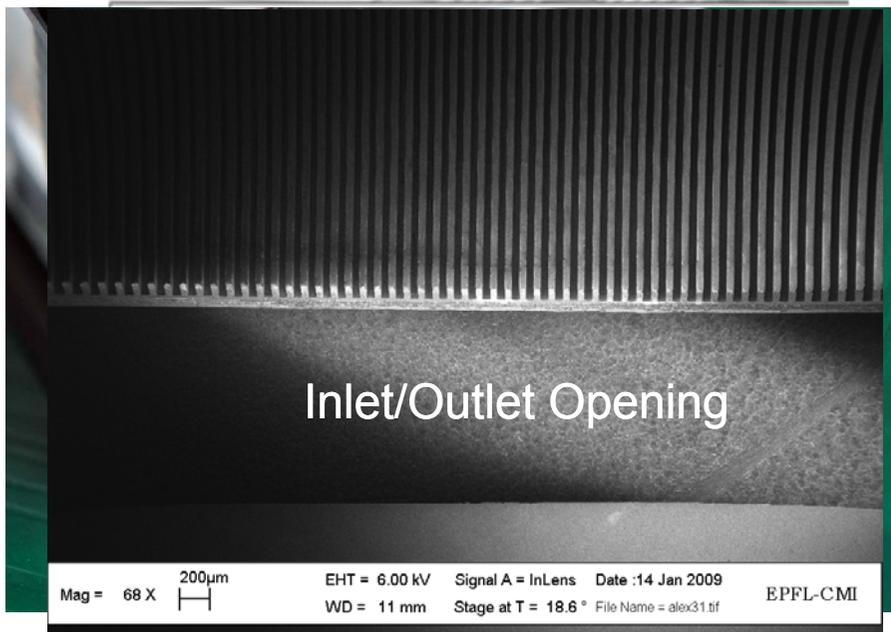

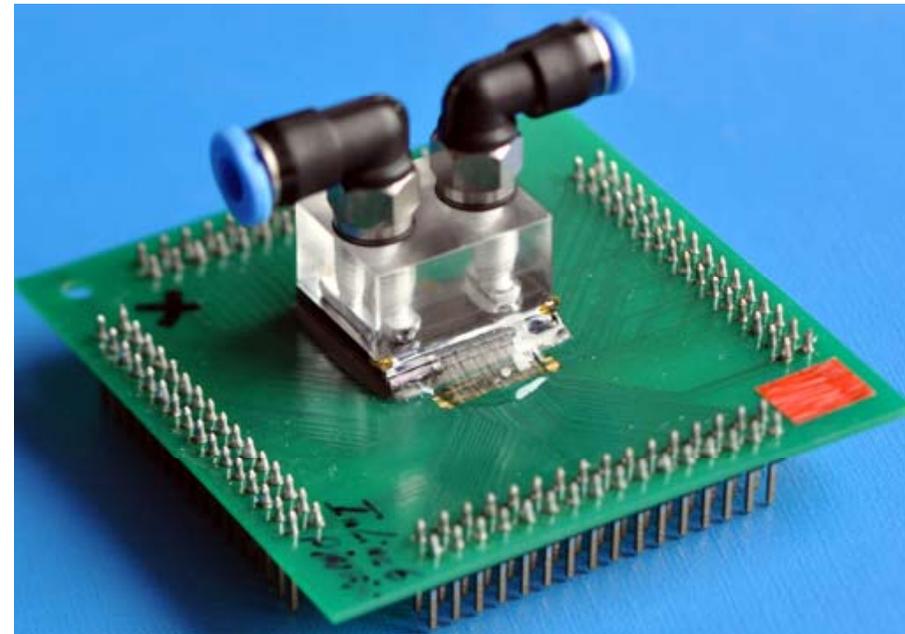

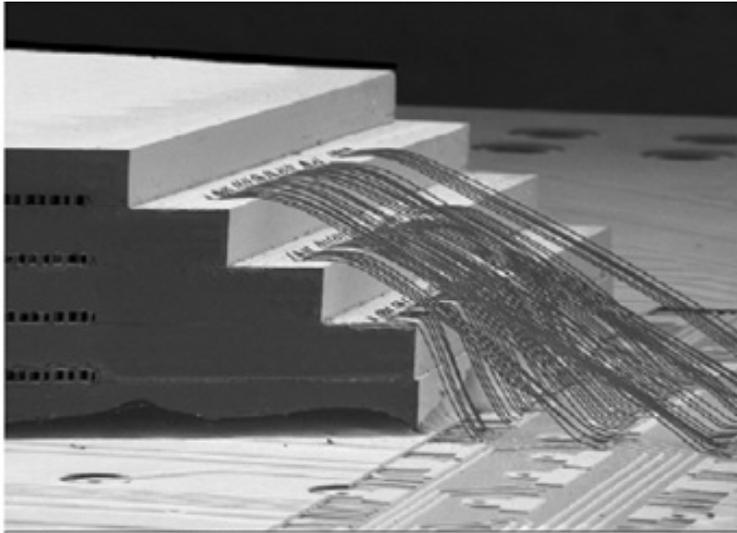

# Manufacturing of 5-Tier 3D Chips with Liquid Channels in Multiple Tiers

Adding multi-tier liquid cooling in-/out-lets

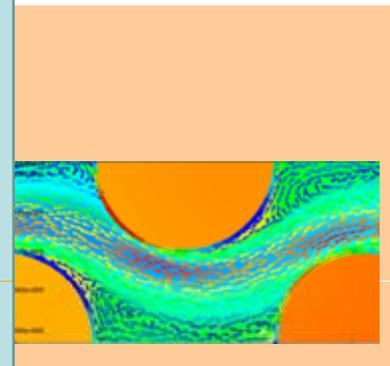

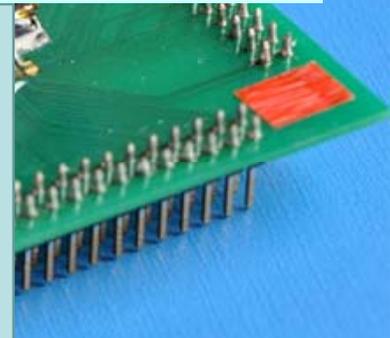

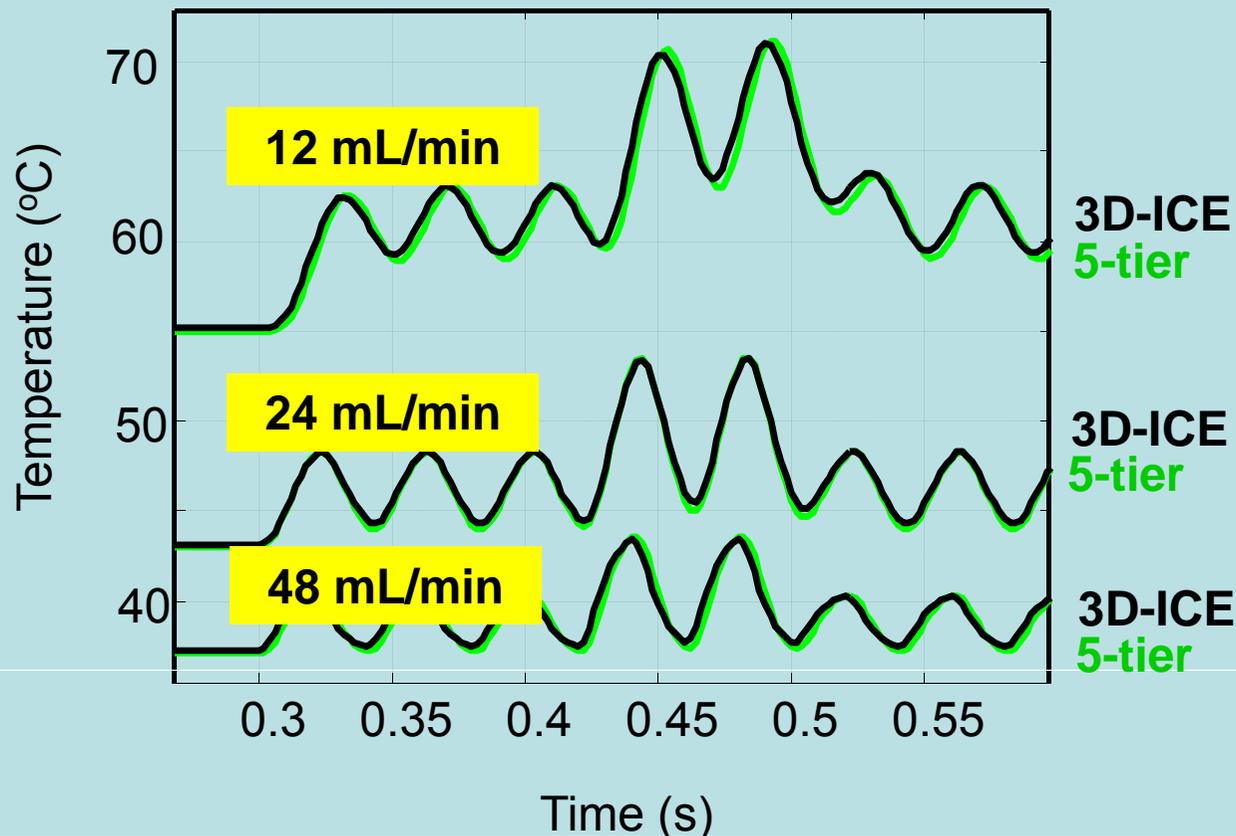

# Manufacturing of 5-Tier 3D Chips with Liquid Channels in Multiple Tiers

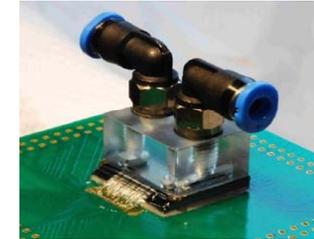

# Manufacturing of 5-Tier 3D Chips with Liquid Channels in Multiple Tiers

Maximum error of 3.5% between measurements and RC-based 3D thermal model with liquid cooling

# Active-Adapt3D: Active cooling management for 3D MPSoCs

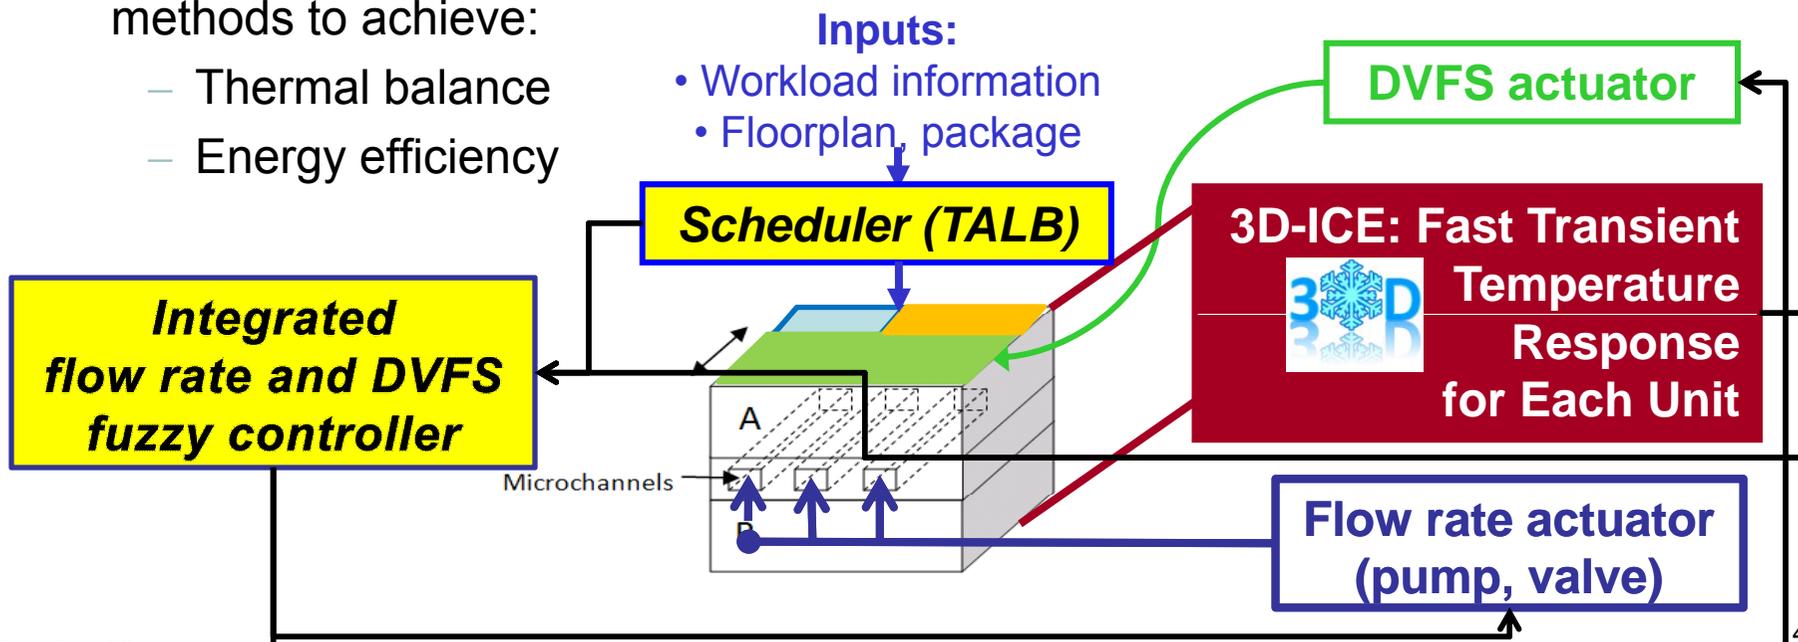

- 3D MPSoC temperature control at system-level:
  - **Electrical based:** task scheduling, and DVFS ( $\mu$ sec or few ms)
  - **Mechanical based:** run-time varying flow rate (hundreds of ms)

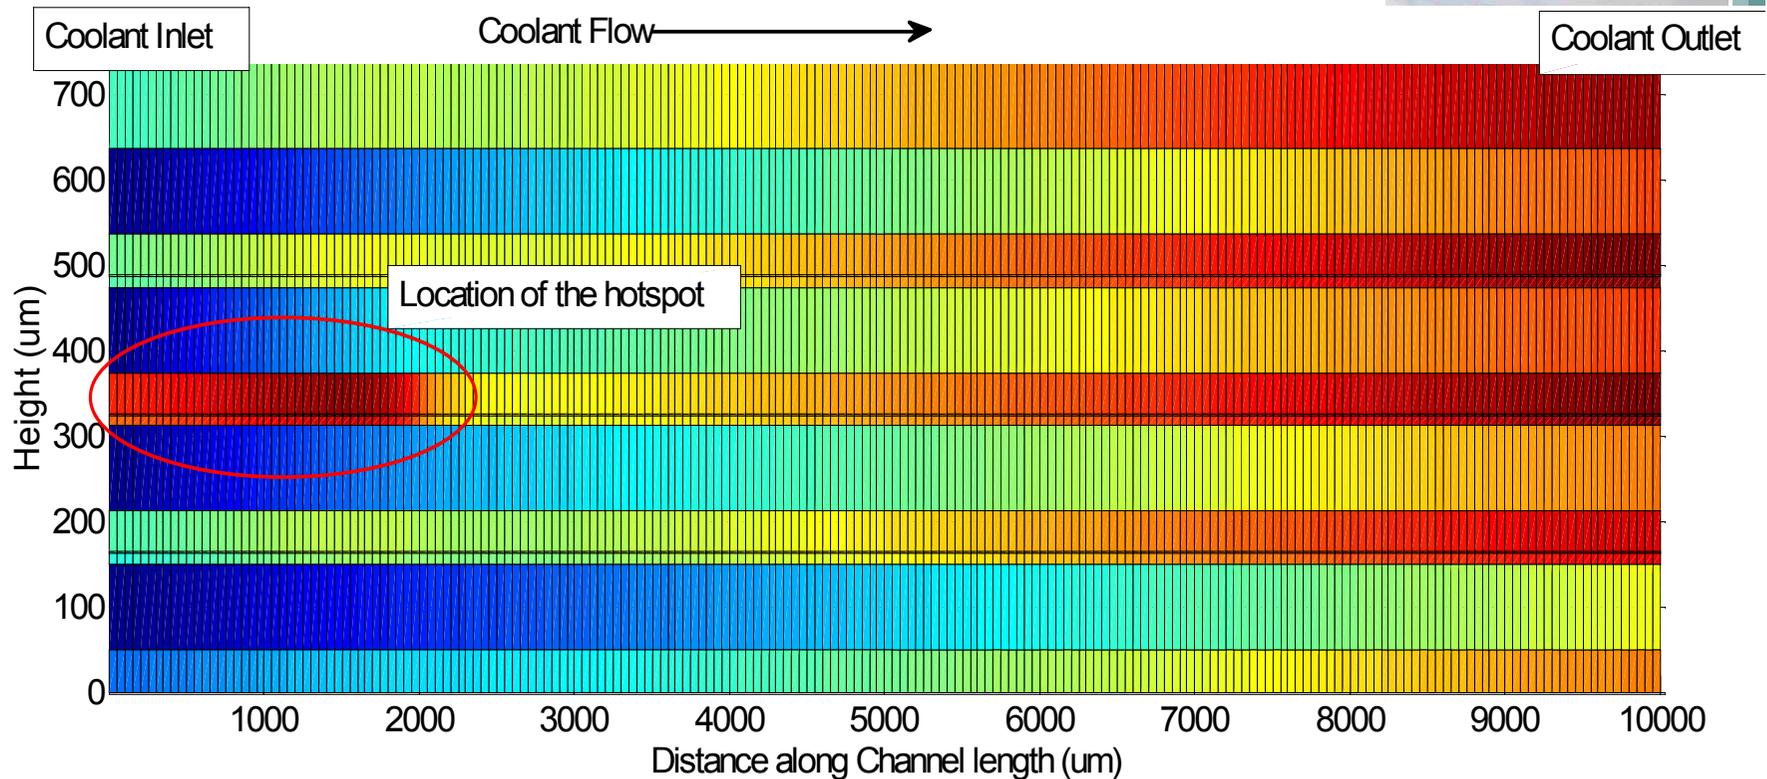

- *Fuzzy logic-based controller and thermal-aware scheduler*

1. **Design-time analysis:** extraction of set of thermal management rules
2. **Run-time thermal management:** utilization of rules in scheduler and subsequently fuzzy logic controller using both mechanical and electrical methods to achieve:
  - Thermal balance
  - Energy efficiency

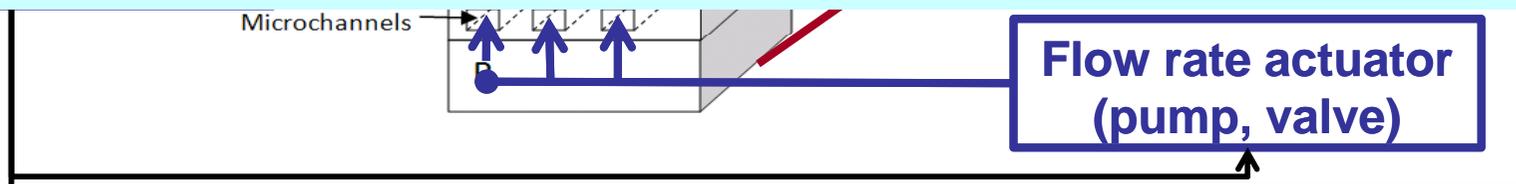

[Coskun, Atienza, et al., MICRO 2011]

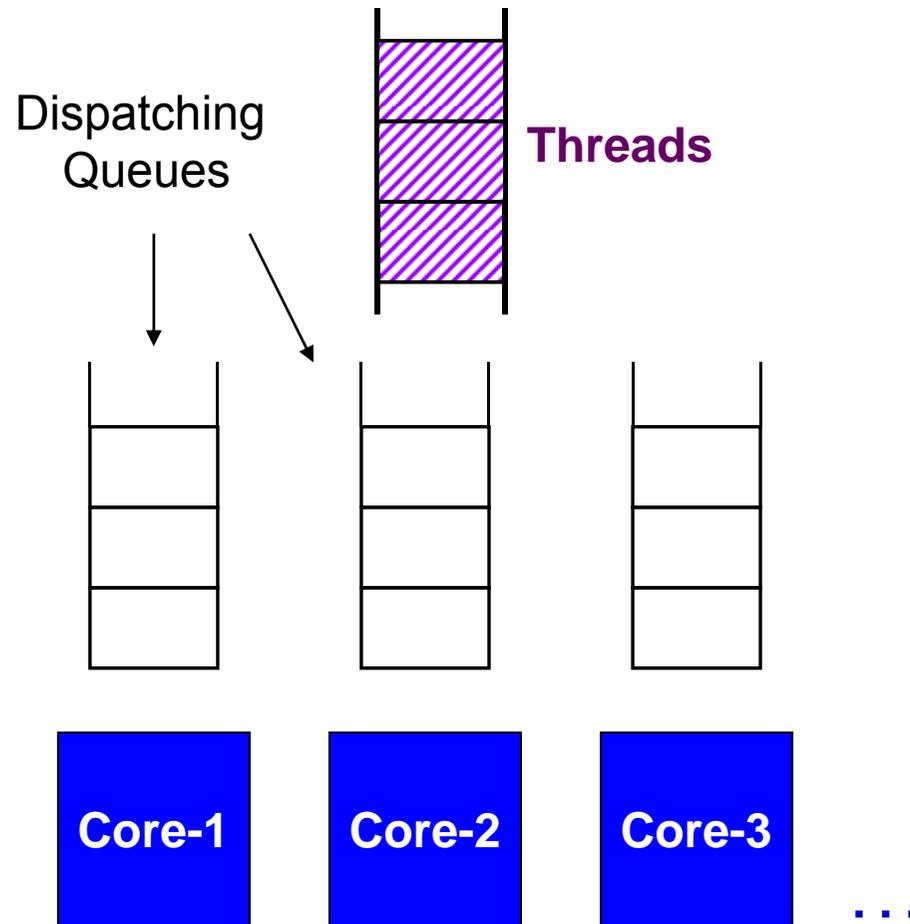

# Active-Adapt3D: Active cooling management for 3D MPSoCs

**New insights about suitable thermal-aware scheduling and task assignment for 3D MPSoCs!**

# Temperature-Aware Load Balancing (TALB) Scheduler for 3D MPSoCs

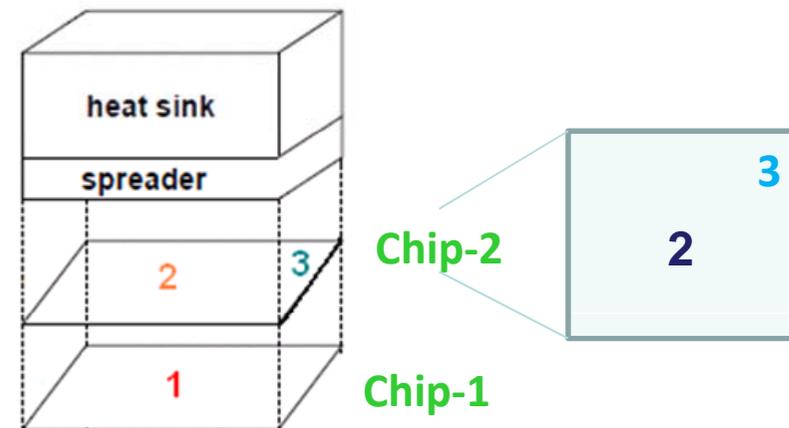

For cores at locations 1, 2 and 3:

$$\alpha^1 > \alpha^2 > \alpha^3$$

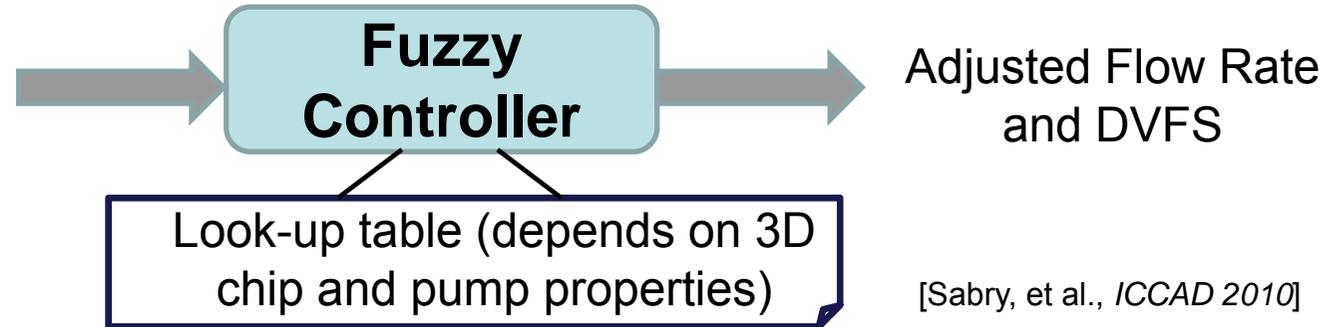

- **Load balancing (Default):**
  - Balances queue-length, but does not consider core locations

- **TALB:** [Coskun, et al., DATE 2010]
  - Thermal index ( $\alpha$ ) per core
 
$$I_{\text{weighted}}^i = I_{\text{queue}}^i \cdot \alpha_{\text{thermal}}^i(T(k))$$

# Integrated Flow Rate and DVFS Fuzzy Controller for 3D MPSoCs

- 3D-ICE: predicted max. core temperat.
- TALB: Workload
- Pump power

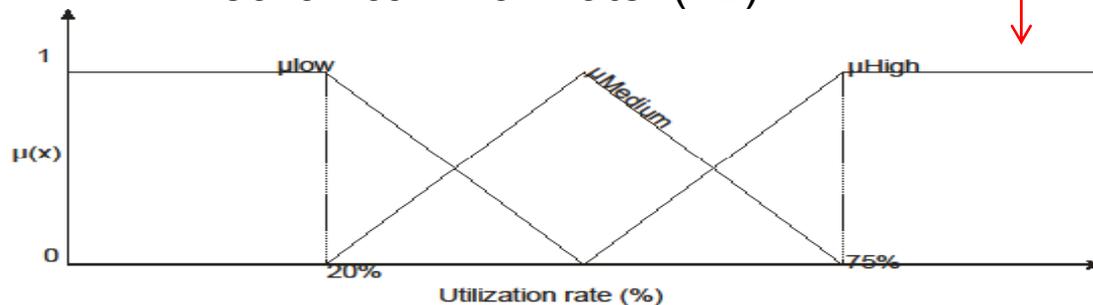

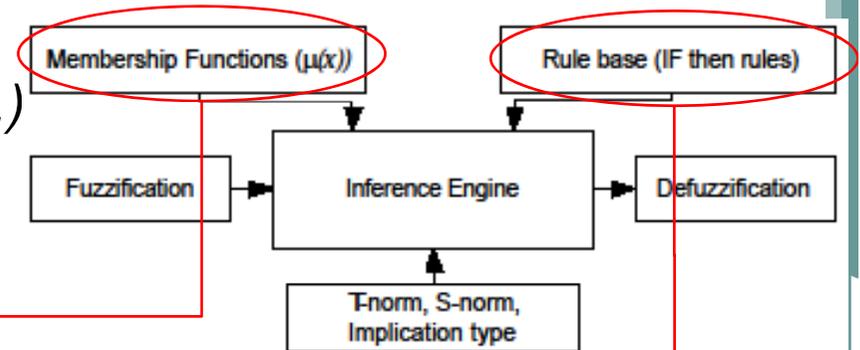

## ■ Takagi-Sugeno fuzzy controller

**IF**  $x_1 = a_1$  **AND**  $x_2 = a_2$  ... **THEN**  $y_1 = f_1(x_1, x_2, \dots)$

- Extract cooling rules at design time
- Stable (circle criteria, BIBO stability, ...)

## ■ Rules for multi-outputs at run-time

- Electrical: DVFS (VF) per core
- Mechanical: Flow rate (FL)

- Cores next to the inlet:  
no thermal reduction needed

**IF D is L THEN VF is H AND FL is L**

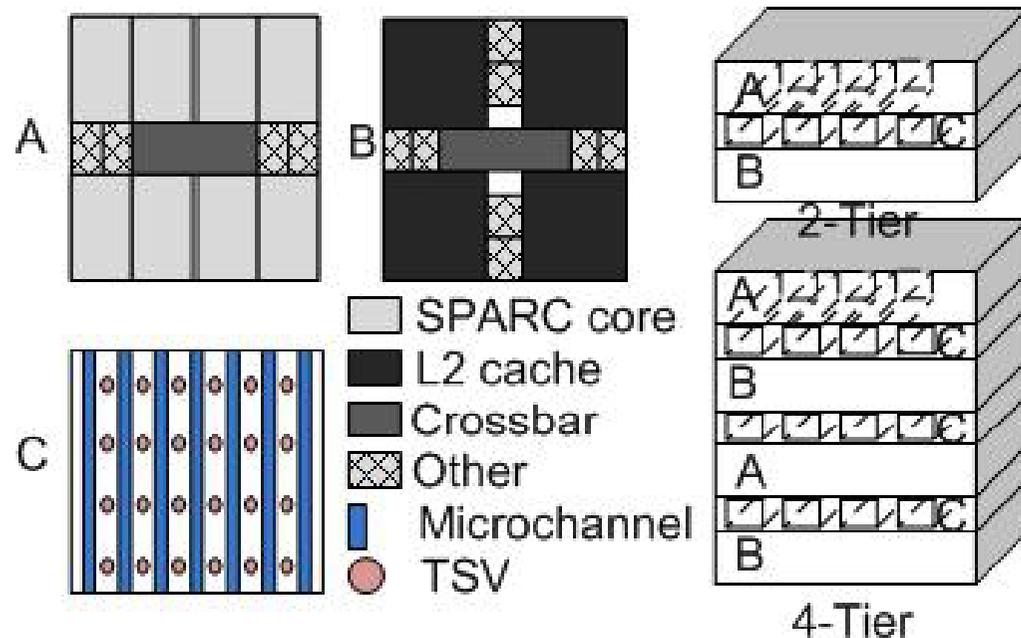

**4-tier chip: ~150 rules**

# Experiments Active Thermal Management 3D MPSoCs with Microchannels

- Target 3D systems based on 3D ICs with Sparc-Power cores
  - Power values and workloads from real traces measured in Sun platforms (database queries, web services, etc.)
- Cores and caches in separate layers
  - 3D crossbar as interconnect

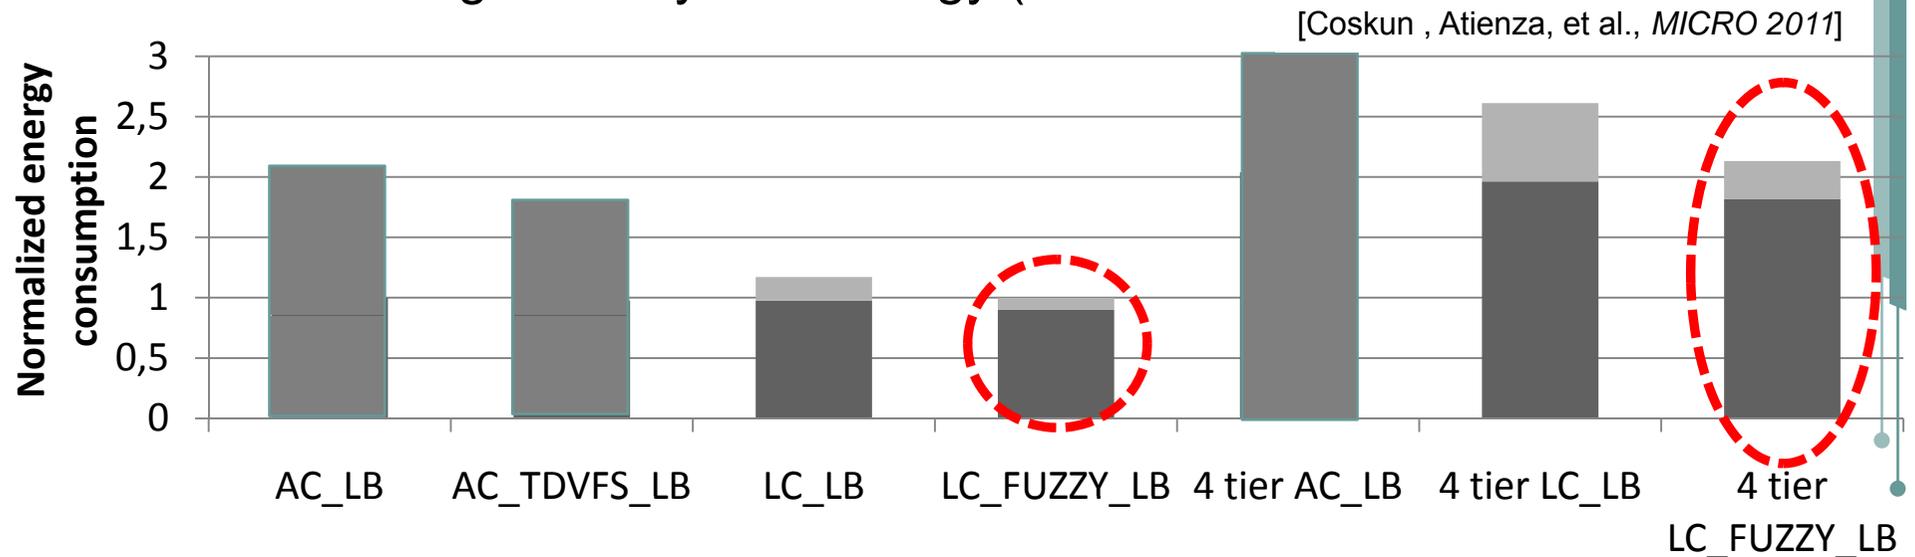

- Channels:

- Width 100 $\mu$ m and height 50 $\mu$ m
- Three flow rate settings, default at 32ml/min

# Run-time thermal Management for 3D Chips: thermal evaluation

- For hot spot threshold 85°C, thermal violations: **0%**
- Energy reduction:
  - **70%** average coolant energy (**max. savings: 77%**)
  - **52%** average total system energy (**max. savings: 85%**)

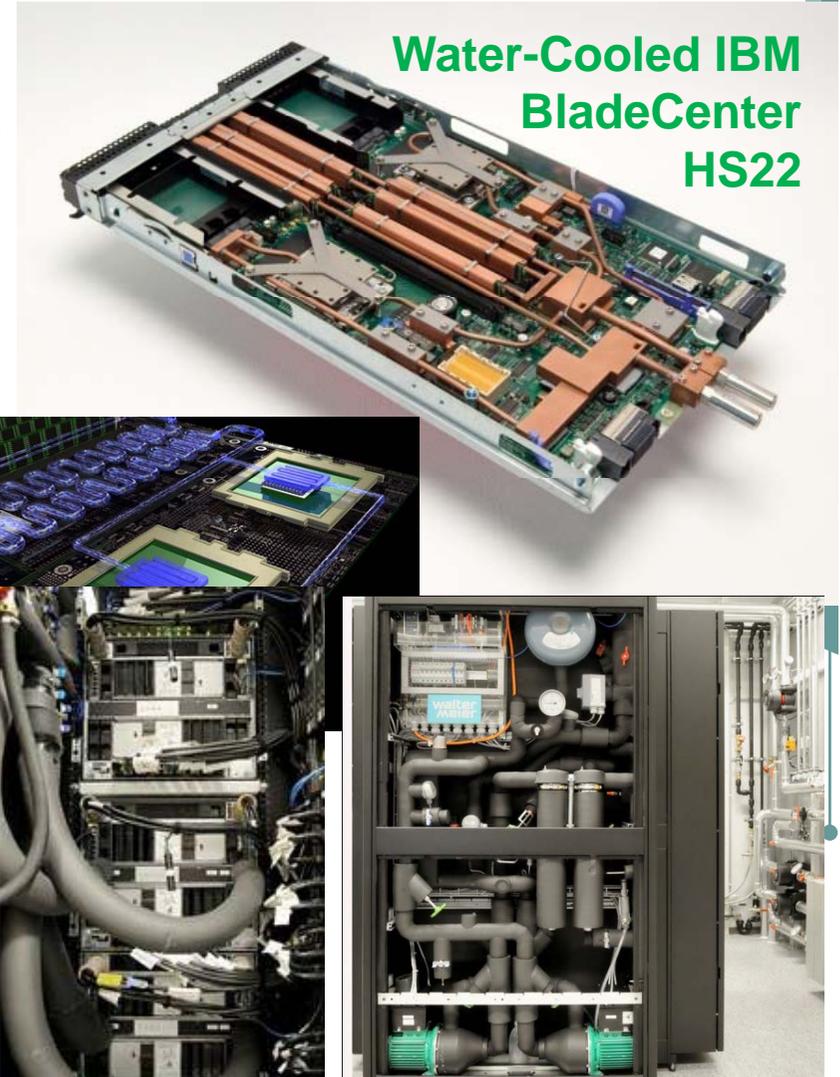

Promising figures for thermal control in 3D MPSoCs, thermal gradients of less than five degrees/tier

# Conclusions: Aquasar 2010

## First Chip-Level Liquid Cooled Server

- MPSoCs: Interdisciplinary work
  - Fast RC thermal models for 2D/3D MPSoC with inter-tier variable liquid fluxes (**less than 5% error**)
  - Layout combining **electrical and mechanical** constraints-modeling
- Next generation of thermal-aware proactive controllers (task control, flow rate and DVFS)
  - Holistic control reduces significantly the thermal issues and improves energy cost (**80% energy savings**)
  - “Green” datacenters: energy efficient
    - Roadrunner: **445 Mflops/Watt**
    - **Aquasar: 2250 MFlops/Watt**
