Focus on Automotive Domain

SAE INTERNATIONAL						
SAE J3016™ LEVELS OF DRIVING AUTOMATION						
	SAE LEVEL 0	SAE LEVEL 1	SAE LEVEL 2	SAE LEVEL 3	SAE LEVEL 4	SAE LEVEL 5
What does the human in the driver's seat have to do?	You are driving whenever these driver support features are engaged – even if your feet are off the pedals and you are not steering			You are not driving when these automated driving features are engaged – even if you are seated in “the driver's seat”		
	You must constantly supervise these support features; you must steer, brake or accelerate as needed to maintain safety			When the feature requests, you must drive	These automated driving features will not require you to take over driving	
	These are driver support features			These are automated driving features		
What do these features do?	These features are limited to providing warnings and momentary assistance	These features provide steering OR brake/acceleration support to the driver	These features provide steering AND brake/acceleration support to the driver	These features can drive the vehicle under limited conditions and will not operate unless all required conditions are met		This feature can drive the vehicle under all conditions
Example Features	<ul style="list-style-type: none"> • automatic emergency braking • blind spot warning • lane departure warning 	<ul style="list-style-type: none"> • lane centering OR • adaptive cruise control 	<ul style="list-style-type: none"> • lane centering AND • adaptive cruise control at the same time 	<ul style="list-style-type: none"> • traffic jam chauffeur 	<ul style="list-style-type: none"> • local driverless taxi • pedals/steering wheel may or may not be installed 	<ul style="list-style-type: none"> • same as Level 4, but feature can drive everywhere in all conditions

Outline

- Automotive trends – Past, Present and Future
- **Automotive Ethernet & TSN**
- Safety Aspects
- Security Aspects
- Conclusions

Why Ethernet in the Automotive Domain?

- **Ever-increasing requirements** of current and future functionalities:
 - High throughput - **infotainment**
 - Low (guaranteed) latencies
 - Fault-tolerance
- **Ethernet benefits:**
 - **Bandwidth:** 100Mb/s → 1Gb/s → 10Gb/s → ...
 - Open network capabilities
 - Shared technology cost (no ownership issues)
 - Huge engineering experience (avionics, industry)
- **Ethernet → communication backbone**
- **Ethernet is a very promising automotive technology**
 - Common view: Ethernet most likely candidate for mono-technological network

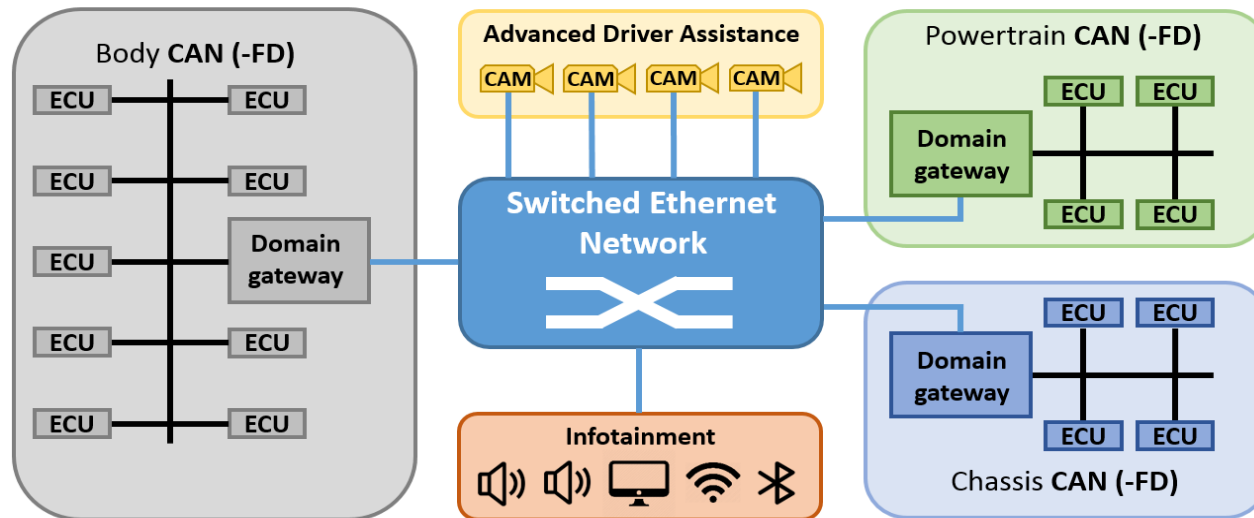

} **Sensor fusion**
Real-time object detection

• Sensors distribution, Image by <http://www.engineering.com>

Ethernet in the Automotive Domain

▪ Envisioned heterogeneous automotive architecture

- **frame preemption** (IEEE 802.1Qbu)
- **stream filtering** (IEEE 802.1Qci)
- **time triggering** (IEEE 802.1Qbv)
- **frame replication & elimination** (IEEE 802.1CB)
- ...

Ethernet TSN

- **Frame Preemption (IEEE 802.1Qbu)**
 - Reduces blocking time of lower-priority frames
 - Allows preemptions of lower-priority frames (at certain points)
- **Per-Stream Filtering and Policing (IEEE 802.1Qci)**
 - Ensure that streams stay within pre-defined bounds (fault containment)
- **Timing and Synchronisation (IEEE 802.1AS-rev*)**
 - Extensions to 802.1AS: redundancy, multiple time domains
- **Time Triggering (IEEE 802.1Qbv)**
 - Time-aware shaper for low latency
 - Time slots protected by guard bands
- **Frame Replication and Elimination (IEEE 802.1CB)**
 - Increased network resilience to transmission faults via redundancy

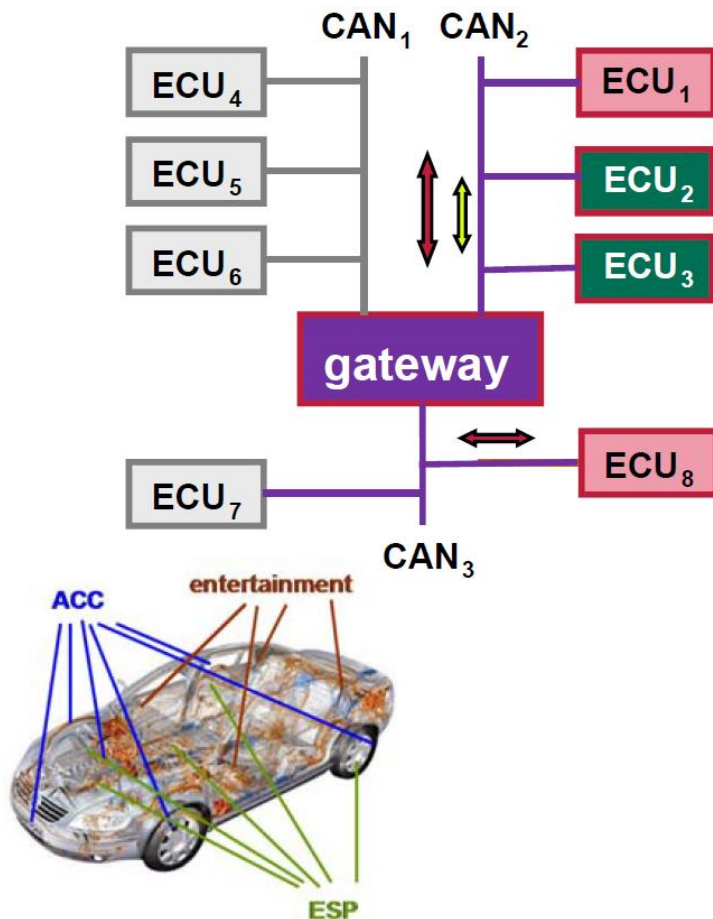

Outline

- Automotive trends – Past, Present and Future
- Automotive Ethernet & TSN
- **Safety Aspects**
- Security Aspects
- Conclusions

Automotive Ethernet Challenges

- **Lost inherent support for pub/sub mechanism** (switch-based)
 - Need to use higher-level protocols
- **Routing necessary**
 - Point-to-point communication with dynamic address handling
 - Different switch scheduling mechanisms, flow control
- **Different communication schemes**
 - Unicast, multicast, broadcast
- **Freedom from interference**
 - How does Ethernet achieve this goal?

Safety Aspects of Current Automotive Networks

- Application of safety standard ISO 26262 affects large part of the system
 - “Freedom from interference!”
- Isolation on mixed-critical busses

- Use priorities to separate criticalities

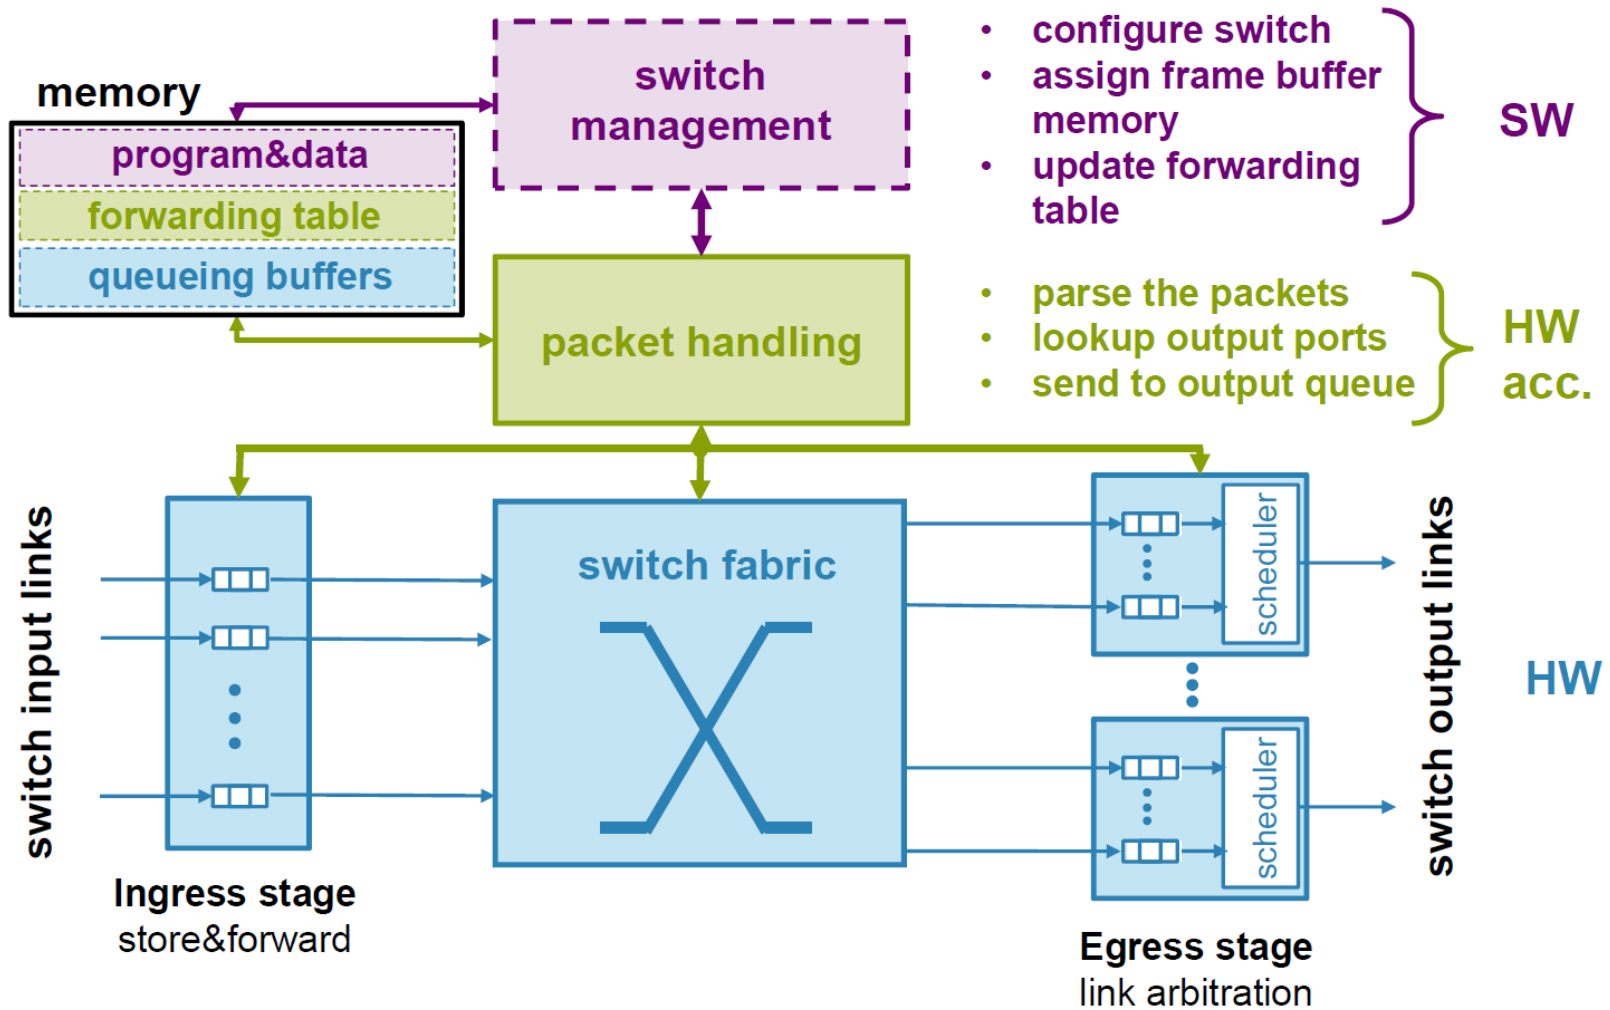

Safety Aspects of Ethernet and TSN

- **Apply similar techniques**
 - Assign priority/preemption classes according to criticality
 - Utilise shaping where necessary
 - Time-triggering
 - Support combinations

But is the isolation effective?

Ethernet Switch Structure

Ethernet Switch Challenges

▪ Forwarding table

- **Limited index space** leads to indexing conflicts
 - Loss of timing → **interference**
 - Thoughtful MAC address management required

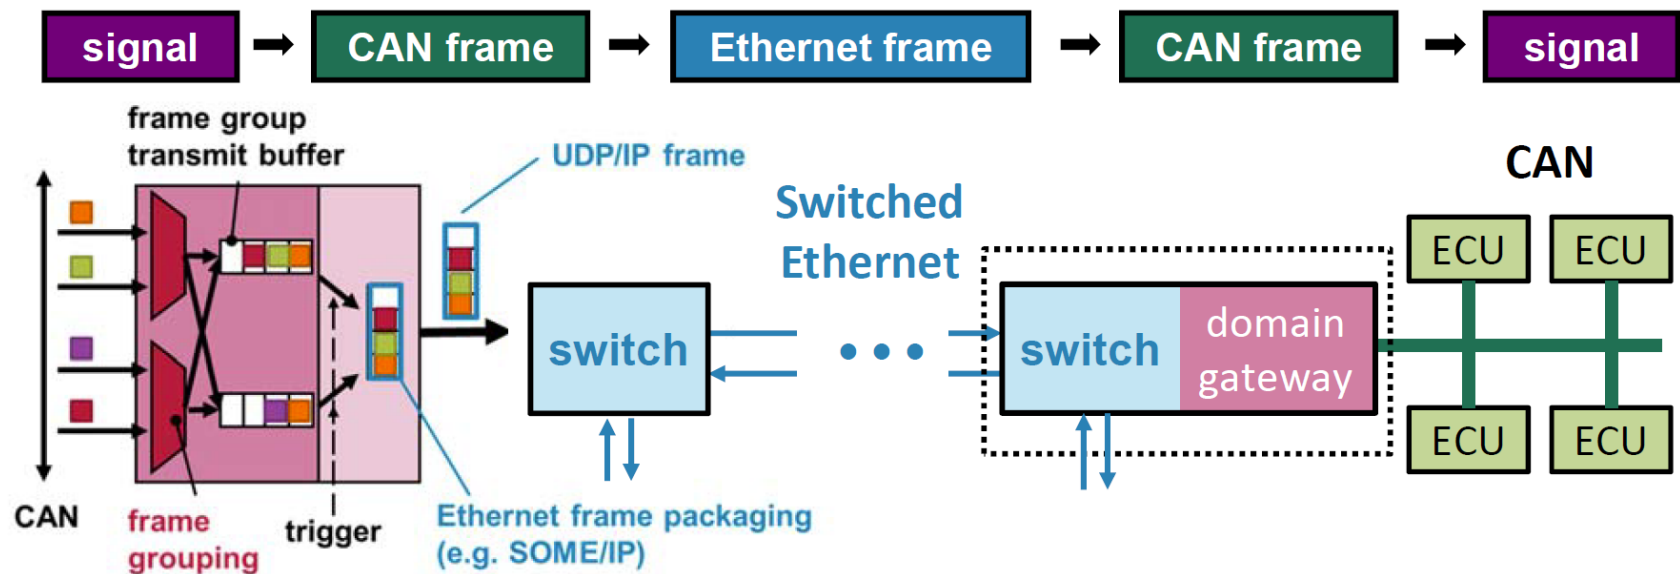

▪ Queuing buffers

- **Limited buffer space**
 - Packet drop → **interference**
- **Flow control**
 - Same-priority blocking, increased delay & buffer
- **Few queues → few priorities**
 - Head of line blocking → **interference**
- Queuing effects require **system-level end-to-end analysis**

Gateway Safety Aspects (CAN → Ethernet scenario)

- **Complex protocol choices**
 - SOME/IP – UDP – IP – MAC
 - TCP – IP – MAC
- **Packaging** is additional **source of interference**

Gateway Safety Aspects (CAN → Ethernet scenario)

▪ Signal grouping:

- By **destination** – minimise multicast overhead
- By **priority** (e.g. CAN ID) – enable QoS for different traffic classes
- By **period** or **deadline** – minimise sampling delay

Gateway Safety Aspects (CAN → Ethernet scenario)

- **Transmission triggering:**
 - **Buffer timeout (AUTOSAR)**
 - Frame is sent periodically
 - **No interference**
 - **Buffer full event (AUTOSAR)**
 - Frame transmitted if buffer full
 - **Interference**
 - **Trigger frames (AUTOSAR)**
 - Immediate release of certain frames
 - **Interference**
 - **Per-frame timeout**
 - Send upon individual frame timeout

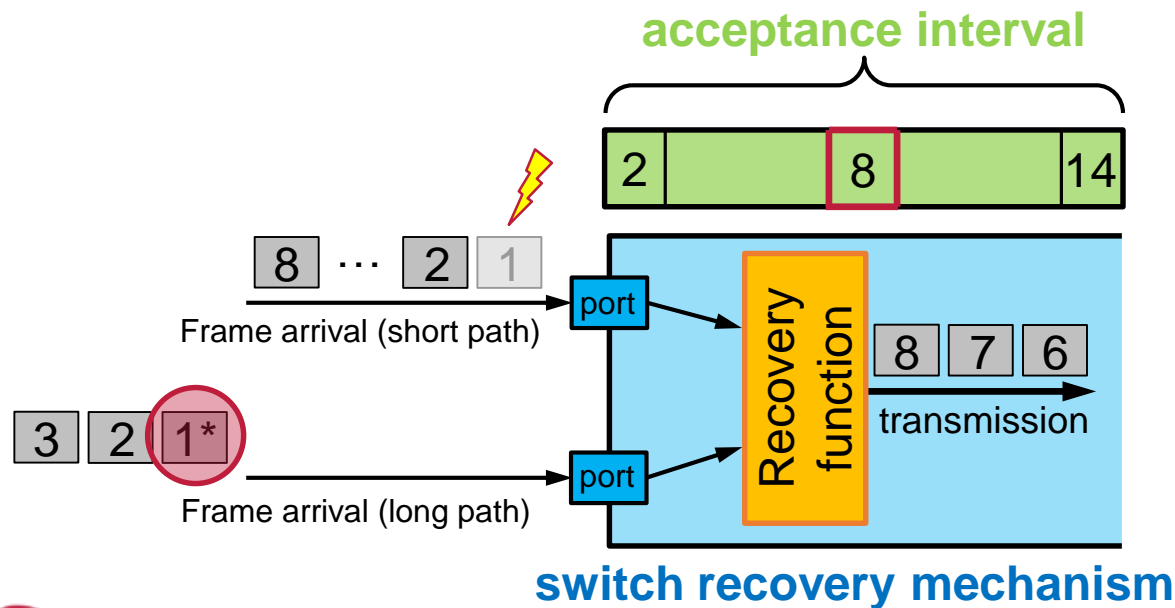

IEEE 802.1CB Safety Aspects

- Standard does **not** prevent out of order transmission of frames
 - Key “unlock – lock” commands, sensor inputs
 - Order preservation must be manually implemented → **interference**

IEEE 802.1CB Safety Aspects

- Standard does **not prevent out of order transmission** of frames
 - Key “unlock – lock” commands, sensor inputs
 - Order preservation must be manually implemented → **interference**
- Standard does **not prevent acceptance interval misconfiguration**
 - Possible dropping of valid frames → **interference**

IEEE 802.1CB Safety Aspects

- Standard does **not prevent out of order transmission** of frames
 - Key “unlock – lock” commands, sensor inputs
 - Order preservation must be manually implemented → **interference**
- Standard does **not prevent acceptance interval misconfiguration**
 - Possible dropping of valid frames → **interference**
- Standard does not provide rigorous fault detection mechanism
 - Periodic latent fault test routine
 - Works on the level of estimates, “guesses”
 - Coverage issues

IEEE 802.1CB Safety Aspects

- **Standard does not prevent out of order transmission of frames**
 - Key “unlock – lock” commands, sensor inputs
 - Order preservation must be manually implemented → **interference**
- **Standard does not prevent acceptance interval misconfiguration**
 - Possible dropping of valid frames → **interference**
- **Standard does not provide rigorous fault detection mechanism**
 - Periodic latent fault test routine
 - Works on the level of estimates, “guesses”
 - Coverage issues
- **Propagation of fault information not addressed**
 - Mechanism needed to timely inform controlling entities about faults
 - Paramount for fail-operational behaviour

Safety Aspects of Ethernet and TSN

- **Plethora of configuration and misconfiguration opportunities**
 - MAC address management
 - Switch management
 - Protocol selection
 - Gateway packaging strategies
- **TSN increases the feature set**
 - Standardisation addresses compatibility, does **not** limit variety
 - Some additions seem similar to AVB (ATS former UBS)
 - **Increased** protocol and circuit **complexity** as well as **switch cost**
 - Are all TSN features useful?
- **Standardised does not necessarily mean safe “out of the box”**
- **Thoughtful application & systematic approaches required!**

- Conclusions

Automotive trends – Future

Vehicles = communicating “software on wheels”

- Vehicle-to-vehicle 
- Vehicle-to-parked vehicle 
- Vehicle-to-infrastructure 

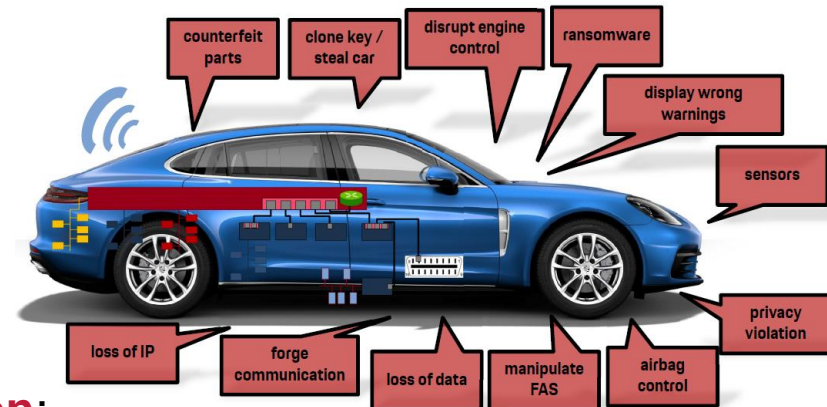

Image capture: May 2015 © 2018 Google Germany Terms Report a problem

Security Aspects of Ethernet and TSN

- **Security** Goals:
 - **Confidentiality** – Protection against unauthorised access to functions and/or information
 - **Integrity** – Correctness of data and system functions
 - **Availability** – Functions and information are available whenever needed
- Properties:
 - Trade-off effort/cost vs level of achieved security level
 - Continuous activity, degrades over time, needs updates
 - Overheads of security measures
- Until few years ago, security not the main concern in Automotive domain
 - First and last talk at AN'17 about security
 - Still gaining increasing amount of attention

Security Aspects of Ethernet and TSN

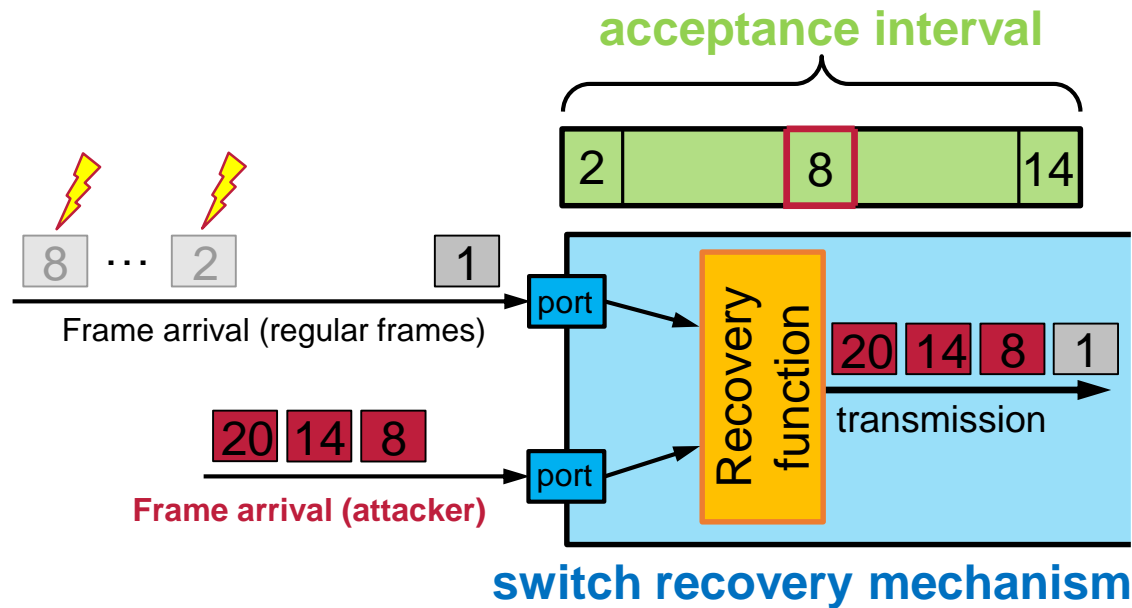

- Automotive vehicles = highly communicating “software on wheels”
- External systems and networks:
 - **Enable** sophisticated **functionalities**
 - But also **increase risk!**
- External threats:
 - **Attacks** and intrusions **via communication**:
 - WIFI, V2V, V2I, Charging stations, mobile device, app. centers
 - Cloud and Edge computing
- Internal threats:
 - Misbehaving & **malicious software**
 - Not all features thoroughly tested
- **Mechanisms** to protect **against both types** of threats **necessary**

Source: Dr. Christian Meineck @ AN'17

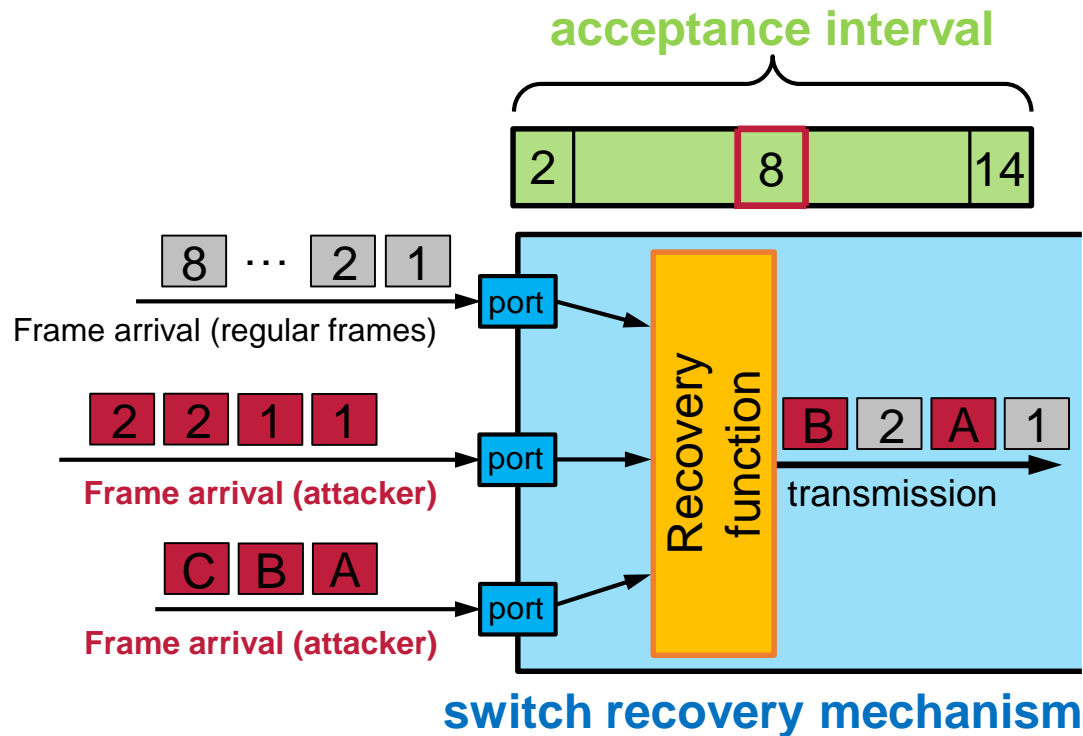

Security Aspects of Ethernet and TSN

- Attack Examples via 802.1CB:
 - Exploiting Acceptance Interval

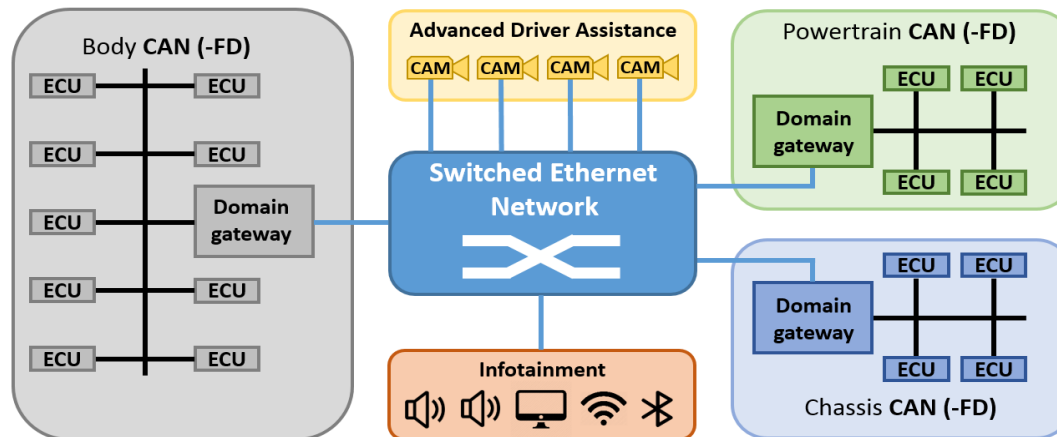

Security Aspects of Ethernet and TSN

- Attack Examples via 802.1CB:
 - Exploiting Acceptance Interval
 - Exploiting Elimination Mechanism

Security Aspects of Ethernet and TSN

- **Security Measures:**
 - **Separation**
 - Build internal security zones
 - Separate internal from external traffic
 - Minimise external connections
 - Use 802.1Q to classify traffic
 - Filtering

IEEE 802.1Qci Security Aspects

- Protection Against:
 - Bandwidth Violation
 - Malfunctioning
 - Malicious Attacks
- Decisions on a per-stream basis
- Stream Filter
 - Filters, Counters
- Stream Gate
 - **Open** or **Closed**
 - Can be time-scheduled
- Meter
 - Bandwidth Profile
 - **Red** / **Yellow** / **Green** Marking

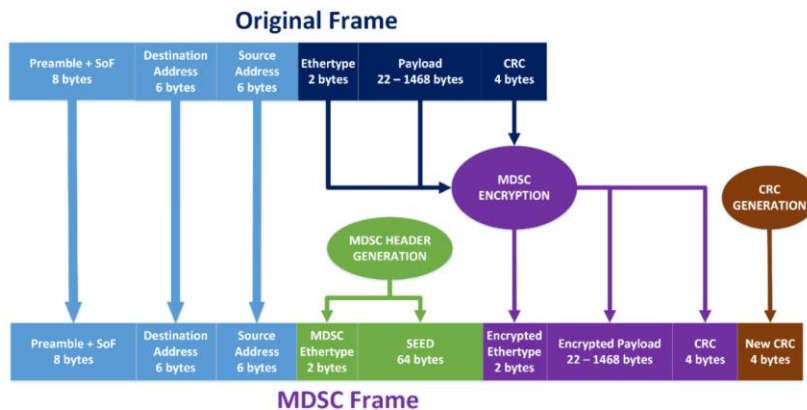

Security Aspects of Ethernet and TSN

- **Security Measures:**
 - **Separation**
 - **Authentication, Encryption**
 - Hop-by-hop vs End-to-end
 - Encryption layer
 - Encrypted information
 - Encryption vs Integrity checks
 - Protection of all vs selected traffic

Security Aspects of Ethernet and TSN

- **MDSC** = Metadat Stream Cypher (TTTech)
 - SAFURE Project
 - End-to-end encryption
 - Applied on Layer 2
 - Compatible with TTEthernet

Security Aspects of Ethernet and TSN

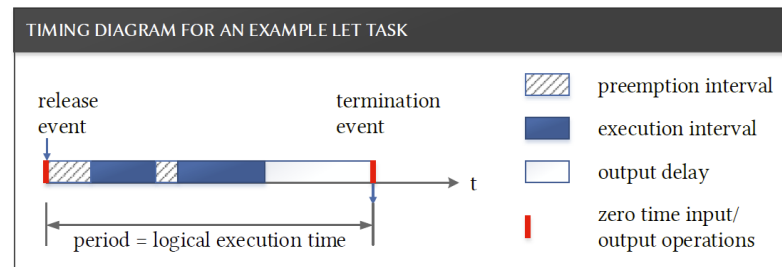

▪ **MACsec (IEEE 802.1AE) applied on Layer 2**

- “... allows authorized systems that attach to an interconnect LANs in a network to maintain confidentiality of transmitted data and to take measures against frames transmitted or modified by unauthorized devices.”
- Compatible with other IEEE 802.1 standards
- Hop-by-hop
- Relatively simple to implement
- Provides: source authentication, data integrity and data confidentiality
- Protection against: Wiretapping, Impersonation, Masquerading, **Man-in-the-Middle**, Replay, Denial-of-Service

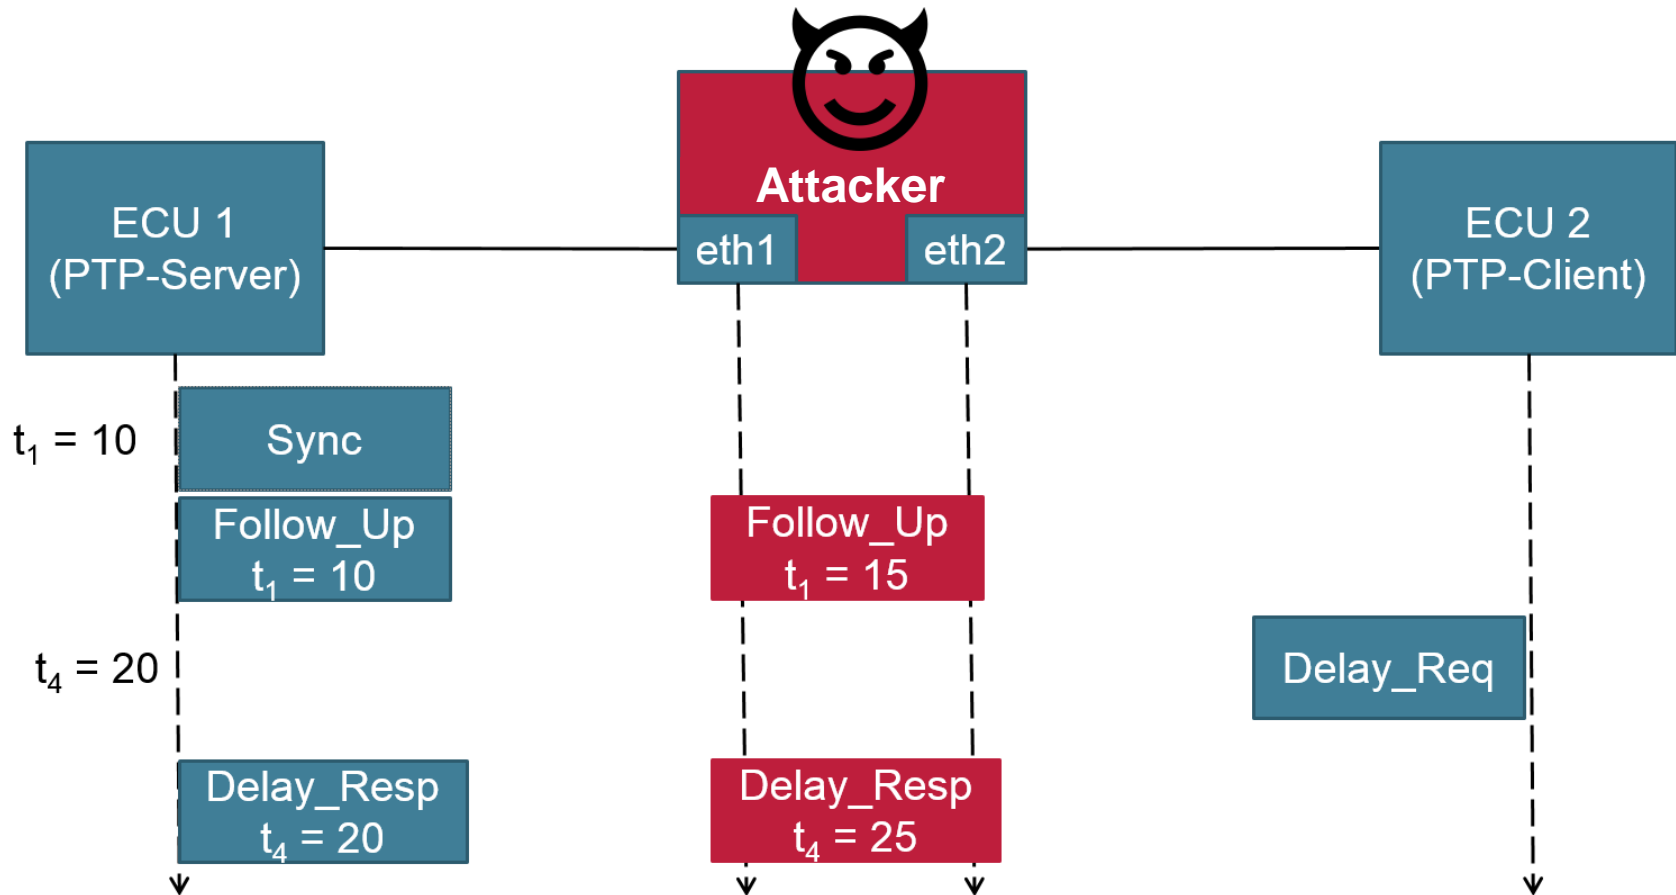

Security Aspects of Ethernet and TSN

- In Ethernet and TSN Networks **timing** very **important**
- Precision Time Protocol (**PTP**)
 - IEEE 1588 HW/SW
 - IEEE 802.1AS (-Rev*)
- Attacks on synchronisation may have catastrophic consequences
- Directly Affected Concepts
 - IEEE 802.1Qbv
 - LET (Logical Execution Time) Paradigm

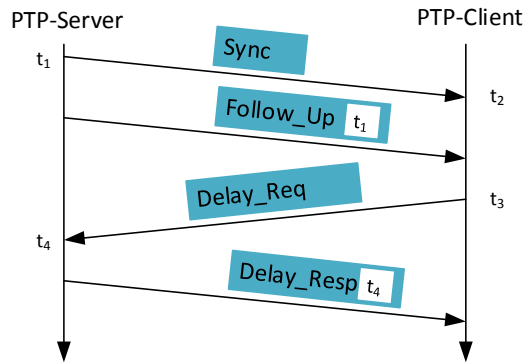

Security Aspects of Ethernet and TSN

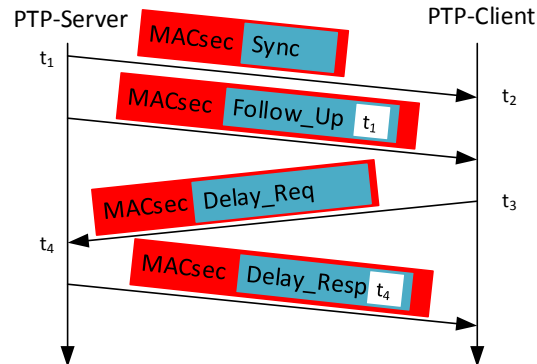

- Attack scenario (Man-in-the-Middle)

Security Aspects of Ethernet and TSN

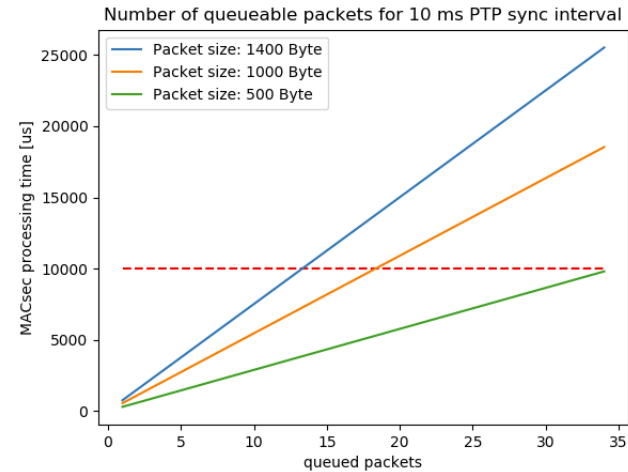

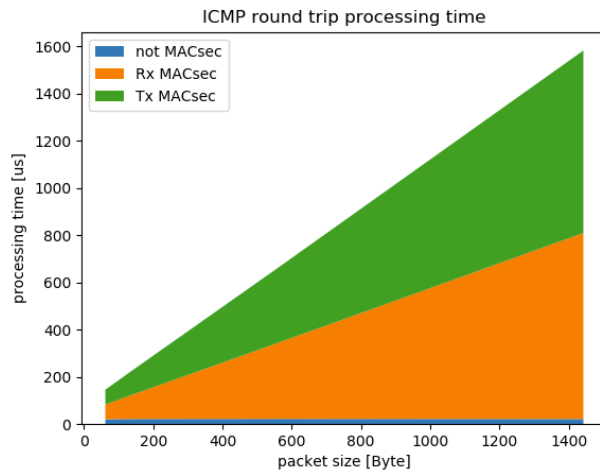

Unprotected PTP

Full MACsec protection

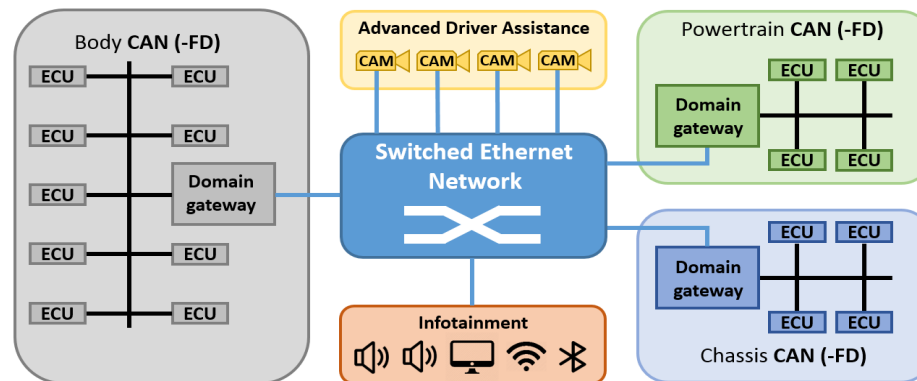

Partial MACsec protection

Security Aspects of Ethernet and TSN

- **Gateways are sensitive network points**
 - Single point of failure
 - Interfaces between domains, often traffic of diverse nature
 - More complex logic and functions than switches
 - Packing and triggering strategies particularly exploitable
 - Security aspects of GW = relevant topic, requires additional attention

Outline

- Automotive trends – Past, Present and Future
- Automotive Ethernet & TSN
- Safety Aspects
- Security Aspects
- **Conclusions**

Conclusions

- **Ethernet and TSN** = **promising** automotive networking technologies
- Many **opportunities & pitfalls**, **careful application** necessary
- **TSN** beneficial but **not panacea**
- Applying **standards** “out-of-the-box” **not always safe**
 - Examples AUTOSAR, IEEE 802.1CB
- **Security** relatively new topic in Automotive domain:
 - Gains in importance due to the ***open-world assumption***
 - Better understanding necessary (experience from other domains helpful)
 - **Integration** with existing and novel **technologies necessary**
 - **Trade-off** gains vs overheads
 - **Never settle**
- **Keep it simple**

Thank you for your attention!
